API Copyrightability Bleak House: 
Unraveling the Oracle v. Google Jurisdictional Mess

Peter S. Menell*

ABSTRACT

Like Dickens’ tale of Jarndyce and Jarndyce, the Oracle v. Google litigation has droned on for what seems like generations in the software industry with no clear end in sight. The litigation is on an especially wasteful and perilous course due to its peculiar jurisdictional posture. As a result of patent infringement allegations lodged in the complaint, the Federal Circuit has exclusive appellate jurisdiction notwithstanding that neither party appealed the rejection of the patent causes of action. Hence, the only issues presented to the Federal Circuit were copyright issues governed by Ninth Circuit, as opposed to Federal Circuit, jurisprudence. The Federal Circuit misinterpreted Ninth Circuit (and general) copyright law, thereby steering the case into a needless fair use retrial.

Congress did not provide a mechanism short of Supreme Court review for ensuring that the Federal Circuit properly interpreted regional circuit law. After tracing the history of the Oracle v. Google litigation and critiquing the Federal Circuit’s analysis, this article evaluates a range of potential reforms to the appellate jurisdictional mess presented by software intellectual property litigation and proposes several solutions to this Dickensian predicament.

Conclusions
API Copyrightability Bleak House: 
Unraveling the Oracle v. Google Jurisdictional Mess

For more than six years, Oracle and Google have fought a costly and still unresolved battle over copyright protection for application program interfaces (APIs). The dispute has significant ramifications for much of the software industry, which has been drawn into a high technology version of Jarndyce and Jarndyce. As Charles Dickens explained in the opening chapter of BLEAK HOUSE:

Jarndyce and Jarndyce drones on. This scarecrow of a suit has, over the course of time, become so complicated, that no man alive knows what it means. The parties to it understand it least; but it has been observed that no two Chancery lawyers can talk about it for five minutes, without coming to a total disagreement as to all the premises. . . . but Jarndyce and Jarndyce still drags its dreary length before the Court, perennially hopeless.

Although the Oracle v. Google litigation has not yet gone on as long as Jarndyce and Jarndyce in human years, it spans several software generations. Software years are more like dog years. The

---

1 An API is a set of subroutine definitions, protocols, and tools for building software and applications. A good API makes it easier to develop a program by providing all the building blocks, which are then put together by the programmer. An API may be for a web-based system, operating system, database system, computer hardware, or software library. An API specification can take many forms, but often include specifications for routines, data structures, object classes, variables, or remote calls.

3 See CHARLES DICKENS, BLEAK HOUSE (1853).

4 In popular lore, one dog year is the equivalent to seven human years. See Erika
industry evolves so quickly that companies that don’t continually innovate wither and die. Building on and interoperating with widely adopted software platforms is the lifeblood of Internet age computing and commerce. Yet the Oracle v. Google litigation looms, like a dark cloud, over the industry.

The Oracle v. Google litigation is on a wasteful and perilous course due to its peculiar jurisdictional posture. In what seems especially ironic in the context of this litigation, Congress established the U.S. Court of Appeals for the Federal Circuit in 1982 for the express purpose of “ending the current legal confusion created by 11 different appellate forums, all generating different interpretations of the patent law.” Congress addressed the problem by granting the Federal Circuit exclusive jurisdiction over patent appeals. Yet the Federal Circuit’s exclusive appellate jurisdiction over cases involving patent infringement allegations has created a new species of interpretive confusion. In patent cases that contain copyright (or other non-patent) causes of action, the Federal Circuit is bound by regional circuit law when reviewing questions that involve law and precedent not exclusively assigned to the Federal Circuit. Moreover, the Federal Circuit will hear the appeals of such non-patent issues even though, as was the circumstance in Oracle v. Google, neither party challenged the district court’s patent rulings. Congress did not provide a mechanism short of Supreme Court review for ensuring that the Federal Circuit properly interpreted regional circuit law.

For reasons summarized in this article and explored in greater depth in a parallel project, the Federal Circuit’s 2014 decision in Oracle v. Google misinterpreted Ninth Circuit law (and copyright law in general). The unusual jurisdictional posture of the Oracle v. Google litigation has produced a Gordian knot of Federal Circuit/Ninth Circuit copyright jurisprudence that cannot easily be untied. Due to the path dependence of the litigation, it is unclear whether the core API copyrightability issue will ever be ripe for Supreme Court review.

Mansourian, How to Calculate Dog Years to Human Years, American Kennel Club (Nov. 16, 2015), http://www.akc.org/content/entertainment/articles/how-to-calculate-dog-years-to-human-years/. The American Veterinary Medical Association offers a more sophisticated formula. The first dog year is equivalent to 15 human years. The second dog year is nine human years. Each additional dog year is five human years. See American Veterinary Medical Association, Senior Pets, https://www.avma.org/public/PetCare/Pages/Senior-Pets.aspx.

8 See PETER S. MENELL, RISE OF THE API COPYRIGHT DEAD?: AN UPDATED EPITAPH FOR COPYRIGHT PROTECTION OF NETWORK AND FUNCTIONAL FEATURES OF COMPUTER SOFTWARE (draft 2016) (hereinafter cited as “RISE OF THE API COPYRIGHT DEAD?”).
Even as *Oracle v. Google* heads back to the Federal Circuit for needless review of a needless second trial, another major software copyright battle governed by this mutant jurisprudence is unfolding in another Northern District of California courtroom. In 2014, Cisco Systems, a leading manufacturer of networking equipment, sued Arista Networks for patent and copyright infringement. As in *Oracle v. Google* litigation, the copyright claims focus on alleged infringement of Cisco’s command line interface (CLI) for configuring, monitoring, and maintaining Cisco devices—an API copyright claim. The district judge in that case faces a dilemma—whether to follow the Ninth Circuit’s jurisprudence or the Federal Circuit’s interpretation of the Ninth Circuit’s jurisprudence. District Judge Alsup, in the *Oracle* case, fell into this trap, which resulted in reversal of his copyrightability determination. The software industry at large faces a similar dilemma.

This article examines how software copyright jurisprudence has arrived at this precarious state and the larger ramifications for the software industry and appellate intellectual property jurisdiction. Part I summarizes the long and winding history of the *Oracle v. Google* litigation. Part II critiques the Federal Circuit’s 2014 copyrightability decision. Part III traces the possible future pathways for the litigation and explains why the confusing cloud of copyright jurisprudence might continue to loom over the software industry. Part IV explores ways of restoring sound appellate jurisdiction.

I. The *Oracle v. Google* Litigation: From Microcomputers to the Internet Age

The *Oracle v. Google* litigation emerged from a dynamic industrial saga that in many ways reflects the evolution of the modern software industry. Section A presents the legislative and jurisprudential backdrop. Section B explores the development of the Java programming language and platform and the Android mobile platform. Section C traces the first six years of the *Oracle v. Google* litigation.

A. Legislative and Jurisprudential Backdrop

This section summarizes the legislative and jurisprudential background to the *Oracle v. Google* litigation.

1. Copyright Legislation

The *Oracle v. Google* saga traces back to Congress’s equivocal decision to bring

computer software within the scope of copyright protection. Computer software could be expensive to develop and was easily pirated, creating a severe appropriability problem for the nascent, yet critical, commercial software industry.\(^\text{12}\) Patent law has long served as the primary intellectual property regime for technological advance.\(^\text{13}\) By contrast, copyright law serves as the principal mode of protection for aesthetic creativity.\(^\text{14}\) Although computer software—as the gears and levers for digital machines—fell within the technological as opposed to the aesthetic arts, its textual form could more easily be protected through a copyright-type regime, which had long proved effective as a means of limiting piracy of literary works. Copyright’s low threshold for protection, complex scope of protection, broad array of rights, and long duration, however, risked over-protecting software and thereby undermining technological innovation and competition.

The software protection controversy emerged at an inopportune time. Congress had been working for nearly two decades to overhaul the Copyright Act of 1909 and was nearing closure in the early to mid 1970s.\(^\text{15}\) Faced with the difficult challenge of fitting computer and other new information technologies under the existing umbrella of intellectual property protection, Congress established the National Commission on New Technological Uses of Copyrighted Works (CONTU) to study the implications of the new technologies and recommend revisions to federal intellectual property law.\(^\text{16}\)

As a stopgap, Congress included software within the scope of copyright protection in the Copyright Act of 1976 (“1976 Act”),\(^\text{17}\) but subject to foundational limitations set forth in § 102(b): “In no case does copyright protection for an original work of authorship extend to any idea, procedure, process, system, method of operation, concept, principle, or discovery, regardless of the form in which it is described, explained, illustrated, or embodied in such

\(^{15}\) See Peter S. Menell, In Search of Copyright’s Lost Ark: Interpreting the Right to Distribute in the Internet Age, 59 J. COPYRIGHT SOC’Y U.S.A. 1, 31-32 (2011).

\(^{17}\) The Act includes “literary works” within the class of “works of authorship.” See 17 U.S.C. § 102(a)(1). The House Report explains that “[t]he term ‘literary works’ does not connote any criterion of literary merit or qualitative value: it includes catalogs, directories, and similar factual, reference, or instructional works and compilations of data. It also includes computer data bases, and computer programs to the extent that they incorporate authorship in the programmer’s expression of original ideas, as distinguished from the ideas themselves.” H.R. Rep. No. 94-1476, 94th Cong., 2d Sess. 53-54 (1976) (emphasis added).
work.” The legislative history noted that

[s]ome concern has been expressed lest copyright in computer programs should extend protection to the methodology or processes adopted by the programmer, rather than merely to the “writing” expressing his ideas. Section 102(b) is intended, among other things, to make clear that the expression adopted by the programmer is the copyrightable element in a computer program, and that the actual processes or methods embodied in the program are not within the scope of the copyright law.

After conducting extensive hearings and receiving expert reports, a majority of CONTU’s blue-ribbon panel of copyright authorities and interest group representatives concluded that the intellectual work embodied in computer software should be protected under copyright law, notwithstanding the fundamental principle that copyright cannot protect “any idea, procedure, process, system, method of operation, concept, principle, or discovery” and the Supreme Court’s foundational decision in Baker v. Selden. CONTU recommended two modest changes to the 1976 Act: (1) defining a computer program as “a set of statements or instructions to be used directly or indirectly in a computer in order to bring about a certain result”; and (2) immunizing “the rightful possessor of a copy of a computer program” to run the program and to make a backup copy of the program from infringement liability. Congress implemented CONTU’s recommendation in its 1980 amendments to federal copyright law with one confusing wording change.

The CONTU Final Report explained that while “one is always free to make a machine perform any conceivable process (in the absence of a patent), [] one is not free to take another’s program,” subject to copyright’s limiting doctrines–originality and the idea/expression dichotomy. The Report further explained that

21 See NATIONAL COMMISSION ON NEW TECHNOLOGICAL USES OF COPYRIGHTED WORKS, FINAL REPORT 1 (1979) [hereinafter CONTU Final Report]; but see id. at 27-37 (Commissioner Hersey, dissenting) (arguing that ‘forcible wrenching’ would be required to protect computer programs under the copyright law); id. at 37-38 (Commissioner Karpatkin, dissenting) (same); cf. id. at 26-27 (Commissioner Melville Nimmer, concurring) (warning that CONTU recommendations might take copyright law ‘beyond the breaking point,’ converting it into a general misappropriation law).
22 See id. at 12.
24 See CONTU Final Report at 20. Courts have treated the CONTU Final Report as
The ‘idea-expression identity’ exception provides that copyrighted language may be copied without infringing when there is but a limited number of ways to express a given idea. This rule is the logical extension of the fundamental principle that copyright cannot protect ideas. In the computer context this means that when specific instructions, even though previously copyrighted, are the only and essential means of accomplishing a given task, their later use by another will not amount to an infringement.\textsuperscript{25}

Thus, while recognizing important limitations on copyright protection for computer software, including the § 102(b) limitations, Congress intended that software programmers would garner protection for their programming design and coding choices to the extent that the expression was separable from the underlying ideas. In this way, the general programming ideas and unoriginal programming choices remain free for others to use while the creative effort in particularized programming choices and compilations, especially in complex programs, gains protection from copyists.

Interpreting and applying the idea-expression dichotomy in software cases, like other important “common law” copyright doctrines,\textsuperscript{26} fell to the courts.

2. Copyright Jurisprudence

The rapid growth of the microcomputer and consumer software industries fueled more than a decade of litigation centered on the scope of copyright protection for computer software. These cases spanned Apple’s litigation to bar clones of its breakthrough Apple II computer, Apple’s effort to block Microsoft Windows from competing with the Macintosh’s graphical user interface, mobile phone companies’ copyright claims to codes for cellular phone networks, Sega’s effort to control access to its Genesis video-game console, and Lotus’s effort to control the menu command hierarchy of the Lotus 1-2-3 spreadsheet program. All of these litigations, and many others, centered on the idea-expression dichotomy: to what extent could platform innovators protect application program interfaces through copyright protection?

The early cases suggested a broad scope of copyright protection for computer software and interoperable features. The first major software copyright cases pitted Apple Computer Corporation, then a young, break-out microcomputer company, against brash competitors

\textsuperscript{25} Id. (footnote omitted).

offering inexpensive “interoperable” Apple II clones. The clone makers quickly entered the market by simply copying, bit by bit, Apple’s operating system and application programs. The defendants argued that copyright protection did not extend to non-human readable (object code) formats of computer software and that the idea-expression doctrine barred copyright protection for operating system programs. They further argued that copyright protection should not stand in the way of their selling computers that can run programs written for the Apple II.

The courts had little difficulty finding that copying the entirety of sophisticated computer programs constituted copyright infringement. In reaching these findings, however, the courts went overboard in some of their dicta. In addressing the defendant’s interoperability argument, for example, the Third Circuit opined that “total compatibility with independently developed application programs . . . is a commercial and competitive objective which does not enter into the somewhat metaphysical issue of whether particular ideas and expressions have merged.” Since two entirely different programs can achieve the same “certain result[s]”—for example, generate the same set of protocols needed for interoperability—the court was not justified in making such an expansive statement about the scope of copyright protection for computer program elements. Given the verbatim copying of millions of bits of object code, there was no need to address the interoperability issue. The defendant offered no explanation of which elements of the program were protectable and which were not.

The next major software copyright appellate decision also arose from the Third Circuit. In Whelan Associates, Inc. v. Jaslow Dental Laboratory, Inc., a computer programmer sued the dental laboratory for which it had developed a computer program for managing its bookkeeping functions for copyright infringement after an officer of the laboratory set out to create a version of the program that would run on other computer systems. The competing software did not literally copy Whelan’s code, but there were overall structural similarities between the two programs. To distinguish protectable expression from unprotectable idea, the court reasoned:

\[
\text{The purpose or function of a utilitarian work would be the work’s idea, and everything that is not necessary to that purpose or function would be part of the expression of the idea. Where there are many means of achieving the desired purpose, then the particular means chosen is not necessary to the purpose; hence, there is expression, not idea.}
\]

29 CONTU was clear that “[o]ne is always free to make the machine do the same thing as it would if it had the copyrighted work placed in it, but only by one’s own creative effort rather than by piracy.” See CONTU REPORT, supra note __, at 21.
30 797 F.2d 1222 (3d Cir. 1986).
31 Id. at 1236 (emphasis in original; citations omitted).
In applying this rule, the court defined the idea as “the efficient management of a dental laboratory,” for which countless ways of expressing the idea would be possible. Drawing the idea/expression dichotomy at such a high level of abstraction implies an expansive scope of copyright protection. Furthermore, the court’s conflation of merger analysis and the idea/expression dichotomy implicitly allows copyright protection of procedures, processes, systems, and methods of operation, that § 102(b) expressly excludes.

Although the case did not directly address copyright protection for interoperability protocols, the court’s mode of analysis dramatically expanded the scope of copyright protection for computer programs. If everything below the general purpose of the program was protectable under copyright, then it would follow that particular protocols were protectable because there would be other ways of serving the general purpose of the program. Such a result would effectively bar competitors from developing interoperable programs and computer systems.

The *Whelan* test was roundly criticized by commentators and other courts began developing alternative approaches to the scope of copyright protection that better comported with the fundamental principles (including limitations) of copyright protection. A few months after the *Whelan* decision, the Fifth Circuit confronted a similar claim of copyright infringement based upon structural similarities between two programs designed to provide cotton growers with information regarding cotton prices and availability, accounting services, and a means for conducting cotton transactions electronically. In declining to follow the *Whelan* approach, the court found that the similarities in the programs were dictated largely by standard practices and forms in the cotton market—what the court called “externalities”—constitute unprotectable ideas.

In 1992, the Second Circuit adapted Learned Hand’s seminal abstraction-filtration-comparison framework to computer software analysis. Computer Associates (CA), a leading

34 *Plains Cotton Cooperative Assoc. v. Goodpasture Computer Service, Inc.*, 807 F.2d 1256 (5th Cir. 1987).
35 Id. at 1262 (finding the commonly used “cotton recap sheet,” for summarizing basic transaction information, to be unprotectable). The court found persuasive the decision in *Synercom Technology, Inc. v. University Computing Co.*, 462 F. Supp. 1003, 1013 (N.D.Tex. 1978), which analogized the “input formats” of a computer program (the organization and configuration of information to be inputted into a computer) to the “figure-H” pattern of an automobile stick shift.
36 See *Nichols v. Universal Pictures Corp.*, 45 F.2d 119 (2d Cir.1930).
mainframe software provider, had developed SCHEDULER, a job scheduling program that worked with three IBM mainframe computers. Part of the success of this program was that it had a sub-component, called ADAPTER, which would interoperate with any of the three IBM mainframes (DOS/VSE, MVS, and VM/CMS). As a result, the user does not need to customize its programs for each of the IBM mainframes. ADAPTER ensured that programs written for SCHEDULER would interoperate with any of the three IBM mainframes.

In developing a competing job scheduling computer program, Altai relied on James Arney, a programmer who had worked for CA. Unbeknownst to Altai’s management, Arney improperly copied 30% of OSCAR’s code from CA’s ADAPTER program into Altai’s ZEKE program. When Altai’s executives learned of the illicit copying, the company initiated a clean-room rewrite of the program. Drawing on the Whelan decision, CA challenged the revised version of ZEKE based on structural similarities. The district court criticized Whelan’s “simplistic test” for determining similarity between computer programs, rejecting the notion that there is but one idea per program and that as long as there were alternative ways of expressing that one idea, then any particular version was protectable under copyright law. Focusing on the various levels of the computer programs at issue, the court determined that the similarities between the programs were dictated by external factors—such as the interface specifications of the IBM operating system and the demands of functionality—and hence no protected code was infringed.

The seminal Second Circuit decision fleshed out a detailed analytical framework for determining copyright infringement of computer program code:

In ascertaining substantial similarity . . ., a court would first break down the allegedly infringed program into its constituent structural parts. Then, by examining each of these parts for such things as incorporated ideas, expression that is necessarily incidental to those ideas, and elements that are taken from the public domain, a court would then be able to sift out all non-protectable material. Left with a kernel, or perhaps kernels, of creative expression after following this process of elimination, the court’s last step would be to compare this material with the structure of an allegedly infringing program.

---

38 982 F.2d at 699. Altai accepted responsibility for copyright infringement based on Arney’s misdeeds and was ordered to pay $364,444 in damages. See id. at 696.
39 A clean room process insulates programmers from copyright protected code in producing code that accomplishes the same functions as a target program based solely on the functional specifications. Such a process ensures a program is independently written and hence not copied except with regard to unprotectable elements. See generally P. Anthony Sammi, Christopher A. Lisy, & Andrew Gish, Good Clean Fun: Using Clean Room Procedures in Intellectual Property Litigation, 25 No. 10 INTELL. PROP. & TECH. L.J. 3 (2013).
41 982 F.2d at 706.
The court’s abstraction-filtration-comparison test recognized that an idea could exist at multiple levels of a computer program and not solely at the most abstract level. Furthermore, the ultimate comparison is not between the programs as a whole but must focus solely on whether protectable elements of the program were copied. Of most importance with regard to fostering interoperability, the court held that copyright protection did not extend to those program elements where the programmer’s “freedom to choose” is circumscribed by extrinsic considerations such as (1) mechanical specifications of the computer on that a particular program is intended to run; (2) compatibility requirements of other programs with which a program is designed to operate in conjunction; (3) computer manufacturers’ design standards; (4) demands of the industry being serviced; and (5) widely accepted programming practices within the computer industry.42

Directly rejecting the dictum in Apple v. Franklin,43 the Second Circuit recognized that external factors such as interface specifications, de facto industry standards, and accepted programming practices are not protectable under copyright law. The formulation of the Second Circuit test evaluates these external factors at the time of the allegedly infringing activities (i.e., ex post), not at the time that the first program is written.44

Commentators warmly embraced the Altai decision45 and the abstraction-filtration-comparison approach has been universally adopted by the courts.46 The Ninth Circuit’s decision in Sega Enterprises Ltd. v. Accolade47 expressly recognized the legitimacy of deciphering and copying lock-out codes for purposes of developing interoperable products. Sega developed a successful video game platform (Genesis) for which it licensed access to video game developers. Accolade, a manufacturer of video games, wanted to distribute versions of its game on the

42 Id. at 709-10. The court observed that “[w]hile, hypothetically, there might be a myriad ways in which a programmer may effectuate certain functions within a program—i.e., express the idea embodies in a given subroutine—efficiency concerns may so narrow the practical range of choice as to make only one or two forms of expression workable operations.” Id. at 708.
43 See Apple Computer v. Franklin Computer Corp., 714 F.2d at 1236.
44 The court emphasized that the first to write a program for a particular application should not be able to “‘lock up’ basic programming techniques as implemented in programs to perform particular tasks.” 982 F.2d at 712 (quoting Menell, Analysis of the Scope of Copyright Protection for Application Programs, 41 STAN. L. REV. 1045, 1087 (1989)).
47 977 F.2d 1510 (9th Cir. 1993).
Genesis platform. It did not, however, want to limit distribution exclusively to Genesis, as Sega required. Rather than license Sega’s code, Accolade reverse engineered the access code through a painstaking effort that entailed making hundreds of intermediate copies of Sega’s computer code. Accolade then incorporated only those code elements (approximately 25 bytes in games containing between 500,000 and 1.5 million bytes) that were necessary to achieve interoperability into its Genesis platform game cartridges.\(^{48}\)

Sega sued Accolade for copyright infringement. In view of the relatively small amount of Sega code in the Accolade game cartridges, Sega focused its copyright claim on the making of intermediate copies of its full computer program made during the process of reverse engineering. The district court rejected Accolade’s argument that such intermediate copies constituted fair use and granted a preliminary injunction.\(^{49}\)

The Ninth Circuit reversed the district court decision, holding that “the functional requirements for compatibility with the Genesis [video game console are] aspects of Sega’s programs that not protected by copyright. 17 U.S.C. § 102(b).”\(^{50}\) Building on that foundation, the court held that “disassembly of object code in order to gain an understanding of the ideas and functional concepts embodied in the code is a fair use that is privileged by section 107 of the Act.”\(^{51}\) The court determined that policies underlying the Copyright Act authorize disassembly of copyrighted object code and the making of intermediate copies to discover unprotectable elements of code.\(^{52}\) The Ninth Circuit reaffirmed and expanded the Sega analysis in Sony Computer Entertainment, Inc. v. Connectix Corp.\(^{53}\)

The Northern District of California and the Ninth Circuit applied the Altai framework to the graphical user interface features of a computer program in Apple Computer, Inc. v. Microsoft Corp.\(^{54}\) Apple Computer alleged Microsoft’s Windows operating system infringed Apple’s copyrights in the desktop graphical user interface for its Macintosh computer system. The copyright issue was muddied by the existence of a licensing agreement authorizing defendants’ use of aspects of Apple’s graphical user interface. The court determined, however, that the licensing agreement was not a complete defense to the copyright claims and therefore undertook an analysis of the scope of copyright protection for a large range of audiovisual elements of computer screen displays.\(^{55}\)

\(^{48}\) 977 F.2d at 1516.

The court found that the unlicensed similarities between Apple’s works and Microsoft’s Windows were either unprotectable or subject to at least one of copyright law’s limiting doctrines. In evaluating the compilation of these elements as a whole, the court applied the “virtual identity” standard and determined that no infringement had occurred. On appeal, the Ninth Circuit affirmed the district court’s dissection of Apple’s graphical user interface to determine which elements are protectable, filtering of unprotectable elements, and application of the “virtual identity” standard.

The copyrightability of command systems for computer software arose in litigation over spreadsheet technology. Building upon the success of the Visicalc program developed for the Apple II computer, Lotus Corporation marketed an enhanced and faster operating spreadsheet program incorporating many of Visicalc’s features and commands into its 1-2-3 program for the IBM PC platform. Lotus 1-2-3 quickly became the market leader for spreadsheets running on IBM and IBM-compatible machines. As a result, knowledge of the program became especially valuable for accountants and managers. The 1-2-3 command hierarchy provided a logically structured menu of more than 200 commands and enabled users to develop customize programs (called macros) for their particular accounting and business planning functions. These investments locked users into the 1-2-3 command structure as their library of macros grew. By the late 1980s, software developers seeking to enter the spreadsheet market could not ignore the large premiums that many consumers placed on transferring their investments in the 1-2-3 system to a new spreadsheet environment, even where a new spreadsheet product offered significant technical improvements over the Lotus spreadsheet.

After three years of intensive development efforts, Borland International, developer of several successful software products including Turbo Pascal and Sidekick, introduced Quattro Pro, its entry into the spreadsheet market. Quattro Pro made substantial design and operational improvements and earned accolades in the computer product review magazines. Quattro Pro

56 The Ninth Circuit developed the heightened “virtual identity” standard for evaluating thinly protected works such as compilations of simple, narrowly protected elements, such as the visual layout of a day planner (comprising a calendar and ruled lines), see Harper House, Inc. v. Thomas Nelson, Inc., 889 F.2d 197 (9th Cir. 1989), and the audiovisual elements for a karate videogame, Data East USA, Inc. v. Epyx, Inc., 862 F.2d 204 (9th Cir. 1988).
57 35 F.3d 1435 (9th Cir. 1994).
60 See Spreadsheet; Borland International Inc.’s Quattro Pro for Windows and Quattro Pro 4.0 for DOS, PC-COMPUTING, Dec. 1992, at 140 (“No doubt about it: Quattro Pro for DOS is the best DOS spreadsheet there is. Period.”); Borland’s Quattro Pro Tops 2.5 Million Units Shipped, BUSINESS WIRE, Jul. 1, 1992 (“Since its introduction in October 1989, Quattro Pro has
offered a new interface for its users, which many purchasers of spreadsheets preferred over the 1-2-3 interface. Nonetheless, because of the large number of users already familiar with the 1-2-3 command structure and those who had made substantial investments in developing macros to run on the 1-2-3 platform, Borland considered it essential to offer an operational mode based on the 1-2-3 command structure as well as macro compatibility. Borland’s visual representation of the 1-2-3 command mode substantially differed from the 1-2-3 screen displays.

Using the Whelan framework, the lower court held that a menu command structure was protectable if there were many such structures theoretically available. The court also found that Borland was not permitted to achieve macro compatibility with the 1-2-3 product, distinguishing the treatment of external constraints noted in the Altai decision on the ground that such constraints had to exist at the time that the first program was created. The First Circuit reversed, holding that the menu command hierarchy was a “method of operation” that fell within the exclusions from copyright set forth in § 102(b). The U.S. Supreme Court granted certiorari and affirmed without opinion by an equally divided vote.

Subsequent appellate decisions reached similar outcomes, although they have not fully subscribed to the First Circuit’s reasoning. Thus, after an inauspicious start, the federal courts implemented a balanced framework for both protecting computer software against piracy and interpreting the idea/expression doctrine in such a way to ensure that copyright law does not extend to functional features of computer technology. Following resolution of the first API copyright war, the software engineering community believed that copyright law did not protect high level functions, labeling conventions, and APIs. Software copyright litigation subsided

62 516 U.S. 233 (1996) (Justice Stevens recused himself from participation in consideration of the case). As a result, the First Circuit’s Lotus decision remained the law in the First Circuit but did not bind other circuits.
63 See MiTek Holdings, Inc. v. ARCE Engineering Co., 89 F.3d 1548 (11th Cir. 1996) (holding that the menu and submenu command structure of a software program for designing wood trusses for the framing of building roofs was uncopyrightable under § 102(b) of the Copyright Act because it represents a process); Mitel, Inc. v. Iqtel, Inc., 124 F.3d 1366, 1373-74 (10th Cir. 1997) (holding that a computer system for automating the selection of telephone long-distance carrier and remotely activating optional telecommunications features lacked the minimal degree of creativity to qualify for copyright protection and should be denied copyright protection under the scènes à faire doctrine because they are largely dictated by external factors such as compatibility requirements and industry practices; but declining to hold that menu command hierarchies are categorically excluded from copyright protection).
64 See Brian Profitt, The Impact of Oracle’s Defense of API Copyrights, ITWORLD (Aug. 23, 2011) (observing that “[h]istorically, APIs have been regarded as not falling under
and there were no major new API copyright judicial decisions until *Oracle v. Google*.

**B. Roots of the Oracle v. Google Litigation**

The Java platform emerged with great fanfare in the mid 1990s, just as the software copyright battles were subsiding, the open source movement was gaining traction, and the Internet was opening for business. The rise of the open source movement and the emergence of the Internet brought about more open and collaborative software development strategies. Sun Microsystems, the developer of Java, embraced the open bandwagon, which fueled widespread adoption of Java for website development. A decade after Java’s release, Google foresaw the need to develop a robust open mobile operating system. It drew heavily upon Java’s widely adopted language and API packages in developing Android.

**1. The Java Platform**

The phenomenal success of the Java programming language and platform was to a large extent serendipitous. To understand Java’s development, it is necessary to go back to the early 1980s and the founding of Sun Microsystems. Sun quickly earned a reputation for its high-end computer workstations and its quirky, business, technological, and innovative culture. Its technology fueled Silicon Valley’s meteoric rise. Sun went public in 1986 under the stock symbol SUNW for Sun Workstations (later Sun WorldWide), and hit $1 billion in revenues in 1988, a record for a Silicon Valley company. Thanks to its reputation for cutting-edge products and engineer-friendly culture, the company attracted a talented and eclectic group of engineers and programmers.

Sun’s revenues and market value grew steadily from its founding into the mid 1990s and skyrocketed during the dot-com boom. Flush with venture capital investment, many start-ups...
wanted the best work stations and servers for their engineering and programming teams.

Sun’s foray into developing a new programming language began in 1990 as a skunkworks project triggered by an effort to retain a top programmer. It initially aimed at developing a new generation of software to replace Sun’s C++ and C APIs and tools. The project evolved into developing a computer language and hand-held device that could be used for digitally controlled consumer products (such as televisions) and computers. Such a language needed to be scaled for embedded systems—computer systems with a dedicated function within other systems.

The team focused on developing a distributed computing environment for set-top boxes, interactive TV, and video cassette recorders through a wireless network. Such a system would required a more compact footprint and hence would have more limited functionality than general purpose computing systems. By 1993, the software (code-named Oak) was integrated into a versatile handheld interactive TV device. Sun was unable, however, to interest consumer electronics or cable companies.

Just when the project looked doomed, Bill Joy, one of Sun’s founders, saw the opportunity to adapt Oak for the nascent, but promising, World Wide Web. Joy realized that Oak could be re-purposed to program Web pages as opposed to consumer devices. “Java,” the renamed project, aimed to develop a simple, lean, platform independent, real-time, embeddable, multi-tasking programming language for Web functionality. Java had a similar syntax to the widely used C language, but was far more compact, efficient, and secure. Of perhaps greatest importance, Java enabled “write once, run anywhere” (WORA) functionality—Java applets could run on Apple, Windows, or UNIX machines. Java also enabled real-time interactivity, multimedia, and animation, which greatly enhanced the dynamism of Web pages, enabling users to interact with websites in new and exciting ways.

With the experimental new software platform reaching fruition, Sun faced a conundrum.
Although Sun had promoted open standards for software interfaces, this project would require free release of a software implementation—i.e., the full program. Marc Andreessen, the University of Illinois wunderkind who created the pioneering Mosaic web browser, had released Mosaic for free for noncommercial use, but major companies were not yet in the business of giving away source code. Many in the industry coveted source code as the crown jewel of high technology businesses and were loath to share it.

Eric Schmidt, Sun’s Chief Technology Officer who had assured the Java development team that they would be insulated from the business managers, sat at the center of an impending corporate storm. As he would later describe,

>[t]he conversation that never took place, but that I could feel all around me, was, “Eric, you are violating every principle in the company. You are taking our technology and giving it away to Microsoft and every one of our competitors. How are you going to make money?” . . . What I really believed was that Java could create an architectural franchise. The quickest way was through volume and the quickest way to volume was through the Internet.

Sun secretly invited a select group of programmers to test Java in December 1994. The test revealed that the WORA functionality was a game-changer and word of Java’s capabilities spread like wildfire throughout the programmer community. Sun officially launched Java in January 1995. The business strategy epiphany came when Marc Andreessen gushed to the San Jose Mercury News that “[w]hat these guys are doing is undeniably, absolutely new. It’s great stuff. There’s so much stuff people want to do over the network that they haven’t had the software to do. These guys are really pushing the envelope.”

82 See David Bank, Why Sun Thinks Hot Java Will Give You a Lift New Software
Having already released Java to a select programmer audience, Sun decided to focus on establishing Java as the standard language for web development and figure out how to make money later. It followed the “profitless” approach to building market share” that Netscape had employed in giving away its Navigator browser.83

Due in part to the robust performance of its hardware divisions,84 Sun could afford to take risk with the revenue side of its software business. It’s larger concern, as manifest in the years ahead, was in preventing Microsoft from dominating the emerging Internet marketplace in the way that it had dominated desktop computing software.85 The WORA approach could be a game-changer across the software competition landscape.86

In May 1995, Netscape licensed Java as part of its market-leading Navigator browser.87 Although Sun authorized Netscape’s use for a pittance,88 it foresaw that this move would rapidly diffuse Java across the programming community and the Web. Sun also provided Java for free to noncommercial users.89 Java’s ability to transform static web pages into engaging, animated, interactive websites revolutionized web design within a matter of months.90

Sun actively disseminated Java through low-cost licensing while seeking to prevent fragmentation of the Java platform.91 Sun’s strategy succeeded in establishing Java as a de facto

89 See Bank, supra note __.
91 Sun sued Microsoft over its efforts to undermine the WORA principle. See RISE OF THE API COPYRIGHT DEAD?, supra note __. John Markoff, Sun Sues Microsoft in Dispute Over Java, N.Y. TIMES (Oct. 8, 1997). After four years of tumultuous litigation, see Sun Microsystems, Inc. v. Microsoft Corp., 21 F. Supp. 2d 1109 (N.D. Cal. 1998) (granting preliminary injunction enjoining Microsoft from distributing any software implementing Java), vacated, 188 F.3d 115 (9th Cir. 1999), reinstating injunction, 87 F.Supp. 992 (N.D. Cal. 2000), Sun and Microsoft
industry standard. Its open and low licensing cost strategy, however, meant Java was “unlikely ever to become a major profit center at Sun, though any increase in Web traffic is bound to increase sales of Sun’s workstations and servers.” The success of Sun’s hardware division through the 1990s alleviated the need for Sun to earn direct revenues from its Java division.

In 1998, Sun released the Java 2 Standard Edition Platform. It contained eight API packages, three of which—java.lang, java.io, and java.util—were necessary to use the Java programming language. It also established the Java Community Process (JCP), a collaborative mechanism for Java users (including many of the leading software and hardware companies) to expand and update the Java platform.

Over the ensuing years, Sun rolled out updates, improvements, and extensions. Among the goals of the JCP was to bring order to the emerging, but fragmented, mobile device ecosystem. The mobile marketplace was taking off in the mid 1990s with a variety of personal digital assistants (PDAs), cell phones, and other consumer devices. In 1998 and 1999, Sun worked with JCP members to develop the Java 2 Micro Edition (J2ME).

Sun’s hardware sales collapsed when the dot-com bubble burst in early 2000 as many of the dot-com companies that had ordered Sun hardware went bankrupt. Sun’s stock went into free-fall. As the technology sector recovered in 2004, advanced microcomputers displaced demand for higher-end Sun workstations. Sun cancelled major processor projects, closed one of

93 See Bank, supra note __.
its two major factories, and initiated a series of lay-offs.97

Sun’s struggles continued, however, resulting in further deep losses during the 2008 financial crisis. Its market value fell 80% between November 2007 and November 2008, resulting in further layoffs.100

2. The Android Platform

Drawing on the Navigator and Java strategy, Google focused on widespread adoption rather than revenue for its eponymous search engine. It offered free access. As the technology press recognized its “uncanny knack for returning extremely relevant results,”101 Google amassed loyal users and separated itself from the crowded pack of search engines. But unlike Netscape and Sun, Google developed a robust revenue model for its “free” to users software: keyword advertising. By October 2000, just as Sun’s hardware business was setting, Google’s AdWords program was launched.102 In August 2001, Google named Eric Schmidt, Sun’s former CTO as its Chief Executive Officer. The press release touted that Schmidt had “led the development of Java, Sun’s platform-independent programming technology, and defined Sun’s Internet software strategy.”103

97 See RISE OF THE API COPYRIGHT DEAD?, supra note __, at __.
101 See Top 100 Web Sites: Search Engines, PC MAGAZINE 118 (Feb. 9, 1999).
102 See Google Company, Our History in Depth, https://www.google.com/about/company/history.
With revenue flowing from AdWords, Google developed a series of new search projects—images, news, shopping, Gmail, maps—which reinforced and expanded its advertising business. Google went public in 2004 and continued to expand its reach with Google Books, YouTube, and other projects.

Google’s leaders foresaw mobile devices as a substantial risk to its advertising juggernaut. The early smartphones, such as RIM’s BlackBerry, did not make effective use of Google’s advertising links. Developing a new mobile platform, however, posed daunting challenges. The mobile marketplace was a morass of telecommunication companies, handset makers, and software providers. The telecommunications companies (telcos) were notoriously protective of their networks. The handset makers (original equipment manufacturers (OEMs)) had divergent strategies and business models. Microsoft and Symbian were promoting

More individuals are using non-PC devices to access the Internet, and versions of our web search technology developed for these devices may not be widely adopted by users of these devices.

The number of people who access the Internet through devices other than personal computers, including mobile telephones, hand-held calendaring and email assistants, and television set-top devices, has increased dramatically in the past few years. The lower resolution, functionality and memory associated with alternative devices make the use of our products and services through such devices difficult. If we are unable to attract and retain a substantial number of alternative device users to our web search services or if we are slow to develop products and technologies that are more compatible with non-PC communications devices, we will fail to capture a significant share of an increasingly important portion of the market for online services.

See id. at 48-50.

proprietary mobile operating systems but without notable success. Google executives feared that Microsoft could steer consumers away from Google search if it were able to establish a successful mobile platform. 110

Google saw promise in Android, a start-up founded in October 2003 to develop “smarter mobile devices that are more aware of its owner’s location and preferences.” 111 Android’s founder, Andy Rubin, had previously developed T-Mobile’s Sidekick, a compact mobile device that provided an authentic web browsing experience. 112 Rubin and Google recognized that an open, competitive strategy could potentially overcome the structural factors impeding development of a breakthrough mobile platform. 113 Google acquired Android for $50 million in July 2005 and put Rubin in charge of its new mobile division. 114

At the first high-level Android planning meeting, the newly-established Android team and Google leaders focused on three questions:

• Which type of Open Source are we?;
• How do we interact with the OSS [open source software community]?;
• How do we Open Source our JVM [Java Virtual Machine]? 115

The Android team planned to use a permissive open source license that merely required licensees to maintain compatibility with Google APIs. 116 Several factors made Java a critical part of their plan: the carriers required it; Microsoft would never pursue it; Java had well-developed, tested tools; Java assured third party app developers that the platform would remain available; a large and growing pool of developers knew Java; and handset makers could cheaply license Java from Sun. 117

Sun’s Java 2 Mobile Edition, which was widely used on feature phones, 118 would not be

118 The term “feature phone” characterizes low-end mobile phones with limited capability—principally voice and text messaging with basic multimedia and rudimentary internet
adequate for the Android platform for several reasons. First, Google sought to design a new platform optimized for the small chips on handsets and add new functionalities. It would use some of the Java API packages and develop others. Second, Google sought to use a less restrictive licensing model than the GNU GPL so as to promote robust downstream innovation and competition. The GPL’s viral share and share alike provision would prevent handset makers and telcos from commercializing proprietary extensions on top of the base platform. Furthermore, these vendors would not want to share that technology under the viral share and share alike model.\footnote{See email from Rubin to Lee (Aug. 11, 2007) (noting that “[t]he problem with GPL in embedded systems is that it’s viral, and there is no way (for example) OEMs or Carriers to differentiate by adding proprietary works. We are builing a platform where the entire purpose is to let people differentiate on top of it.”) (Trial Exhibit 230, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA).}

The Android team believed that they could achieve their goal by negotiating the first open source Java 2 Platform, Micro Edition license with Sun.”\footnote{See Android GPS [Google Product Strategy]: Key strategic decisions around Open Source, p. 9, July 26, 2005 (Trial Exhibit 1, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA). The memo noted that Tim Lindholm, a former Sun Microsystems engineer who was involved with Java, see John Letzing, \textit{Who Is Tim Lindholm? Google’s CEO is Wondering That Too}, WALL ST. J. (Apr. 18, 2012), http://blogs.wsj.com/digits/2012/04/18/who-is-tim-lindholm-gogles-ceo-is-wondering-that-too/, who then worked for Google would lead the negotiation. See Android GPS [Google Product Strategy], \textit{supra} n.___, at 9.} The preliminary negotiations went well and both sides believed that an agreement would be consummated.\footnote{See email from Brian Swetland (Jan. 2, 2006) (Trial Exhibit 13, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA); email from Andy Rubin to Sergey Brin (Jan. 13, 2006) (Document 398-10, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA), http://www.fosspatents.com/2011/09/sun-proposed-red-hat-style-android.html; email from Scott McNealy, contained in email from Vineet Gupta (Feb. 9, 2006) (Trial Exhibit 16, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA); email thread from Gupta, (May. 8, 2006) (Trial Exhibit 2372, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA).} The negotiations unraveled, however, over Google’s unwillingness to agree to make Android fully compatible with the Java platform.\footnote{See email from Schmidt to Rubin, (May 14, 2006) (Trial Exhibit 215, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA); email from Desalvo to Rubin, (Jun. 1, 2006) (Trial Exhibit 2372, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA); \textit{DOGFiGT}, \textit{supra} note __, at 57 (reporting that Sun would not agree to forking of its platform); See email from Rubin to Lee (Aug. 11, 07) (explaining Sun’s profit motivation for choosing GPL for Java ME: “Sun chose GPL . . . so that companies would need to come back to them and take a direct license and pay royalties.”; noting that Google “negotiated 9 months with Sun and decided to walk away after they threatened to sue us over patent violations.”) (Trial Exhibit 230, Oracle America, Inc.}
deal-breaker for Google.

Google pushed ahead with its selective use of Java API packages by independently implementing the functional specifications in a clean-room environment.\textsuperscript{123} Using the Java language would not be a problem as it had long been freely available. But the Android team also wanted to use selected Java API packages from the Java™ Standard Edition and develop its own virtual machine. If the Java programming language is analogized to the letters, words, and syntax of the English language, the API implementations can roughly be characterized as paragraphs or chapters within a book. Copying the full API implementations—involving large chunks of source code—would run afoul of copyright law. Android could achieve its goals by emulating the API functionality with independently written implementing code. And by avoiding restrictive licensing terms with Sun, Google could blaze its own trail free of Sun’s interference.\textsuperscript{124}

Google recognized that this path risked copyright and patent infringement. The copyright issue turned on whether and to what extent the function labels and structure, sequence, and organization (SSO) of Java APIs were protected by copyright law. As a result of the Supreme Court’s deadlock, the \textit{Lotus v. Borland} decision, which cleared the way for copying of function labels, strictly governed only in the First Circuit. The Second Circuit’s \textit{Altai} decision and the Ninth Circuit’s \textit{Apple} decision exposed the weakness of the Third Circuit’s superficial analysis of SSO in \textit{Whelan}. Furthermore, the \textit{Altai} decision and the Ninth Circuit’s \textit{Sega} decision clearly viewed achieving interoperability with another computer interface through a different implementation to be fair game, but Android was aiming for something other than end user interoperability. It wanted to pick and choose among interface elements in building a new platform—an optimized interface for a different consumer product.

Over the next two years, the Android team independently implemented 37 of the 166 Java API packages in the Java™ Standard Edition\textsuperscript{125} and developed an independent virtual machine (“Dalvik”). In this way, the Android operating system emulated the functionality of known and tested APIs that fit the Android team’s constrained design parameters. Android’s use of the same function labels as Java would enable millions of Java programmers to quickly master Android app development. Although Android apps would not be fully interoperable with Java,
they would be similar and better optimized to the constraints of mobile devices.\footnote{See Stephen Shankland, Google Carves an Android Path through Open-source World: Google is committed to many open-source tenets with its Android mobile phone software—but it's willing to step on a few open-source toes, too. C|NET (May 22, 2008), http://www.cnet.com/news/google-carves-an-android-path-through-open-source-world/.} This clean-room effort added substantially more time and cost to Android’s development, but avoided literal copying of the Java API implementation code.\footnote{See DOGFIGHT, supra note __, at 57.}

With the breakthrough success of the Apple iPhone in 2007, Google came to see Android as critical to its business strategy.\footnote{See DOGFIGHT, supra note __, at 129-30.} The iPhone propelled Apple into a dominant position in the emerging smartphone marketplace. Google feared that Apple could rule mobile technology in much the way that Microsoft had ruled the desktop market, thereby threatening Google’s strength in search and other Internet services. In response, Google allocated more resources to the Android project.\footnote{See Android GPS Meeting Notes (Jul. 17, 2007) (Trial Exhibit 433, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA); DOGFIGHT, supra note __, at 83-84.} The Android team found it far easier to negotiate partnerships with the many telcos and handset manufacturer marginalized by Apple’s decision to produce its own device and license the iPhone exclusively with AT&T.\footnote{See DOGFIGHT, supra note __, at 119-21.}

Google began the rollout of the Android platform in early November 2007.\footnote{See Open Source Alliance, Industry Leaders Announce Open Platform for Mobile Devices: Group Pledges to Unleash Innovation for Mobile Users Worldwide (Nov. 5, 2007), http://www.openhandsetalliance.com/press_110507.html; Miguel Helft & John Markoff, Google Enters the Wireless World N.Y. TIMES (Nov. 5, 2007), http://www.nytimes.com/2007/11/05/technology/05cnd-gphone.html; Saul Hanseel, The Gphone: So Open It Could Be Closed, N.Y. TIMES (Nov. 5, 2007), http://bits.blogs.nytimes.com/2007/11/05/the-gphone-so-open-it-could-be-closed/.} On November 5th, Google unveiled the Open Handset Alliance, a consortium of handset makers, application developers, telcos, and components manufacturers (such as chip makers), in conjunction with the outlines of the Android platform.\footnote{See Open Handset Alliance, supra note __.} Andy Rubin explained that Android’s software was based on the Linux operating system and Sun’s Java language, which would enable programmers to easily develop applications that connect to independent Web services.\footnote{See DOGFIGHT, supra note __, at 83-84.}

Jonathan Schwartz, Sun’s CEO, publicly applauded Google’s use of Java, proclaiming that Google had “strapped another set of rockets to the [Java] community’s momentum—and to
the vision defining opportunity across our (and other) planets.”134 Privately, Sun feared that Android’s use of Java would undermine its WORA paradigm and its mission to establish Java ME as the leading mobile platform and a significant revenue generator.135

The following week, Google released the “open source” Android Software Development Kit (SDK), which enabled companies to implement their own smartphones.136 Google did not, however, release the Android source code, indicating that it would not be available until the first Android phones went on sale in late 2008.137 Nor did Google release its own branded phone, although it left that option open.

Based on the Android SDK, Sun and other industry observers could see that Google was diverging from the Java standard platform and the Java Community Process.138 Google deflected

\footnote{142} Sun had proposed to license Java to Google for $60 million over three years plus an additional amount of up to $25 million per year in revenue sharing. See Letter from Scott Weingaertner (Counsel to Google) to Judge Alsup (Jun. 6, 2011) at p.5, (Document 182, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA), https://www.scribd.com/document/58133136/Oracle-Google-Damages-June-6-Precis-
Sun refrained from blocking Android through legal action.

The marketplace resolved the fate of the two companies. Rubin’s vision proved prescient: “When you have multiple [handset makers] building multiple products in multiple product categories, it’s just a matter of time” before sales of Android phones exceed the sales of proprietary systems like Apple’s and R.I.M.’s.” After a gradual start, Android took the global smartphone operating systems market by storm, surpassing the Apple iOS market share by mid 2010 and leaving Java ME, RIM, Microsoft, and Symbian in the dust.

With its hardware business in decline, software acquisitions sputtering, and inability to monetize Java, Sun Microsystems’s ability to move forward as an independent company came into question. Oracle Corporation, one of the strongest software companies that had built many of its products on the Java platform, swooped in.

Oracle’s acquisition of Sun brought legal action against Google into play. Notwithstanding consternation over Android’s “unofficial,” non-standard, and incomplete Java implementation, suing Google would have gone against Sun’s long-standing

Unredacted. It is unclear whether that offer would have afforded Google the flexibility and independence in developing Android that it sought.

cultural norms about open technology and evangelism within the industry. Moreover, Sun could ill-afford a prolonged litigation battle and the risk to Sun’s reputation with other technology companies. Google was well-positioned financially and legally to put up a stiff defense. Sun’s business was struggling and Wall Street and potential suitors would likely have seen such a lawsuit as a sign of desperation and a distraction from Sun’s business goals.

Oracle’s acquisition of Sun Microsystems dramatically altered the Java enforcement equation. Larry Ellison, Oracle’s co-founder and CEO, had a reputation for brash business tactics. Whereas Sun’s leadership had embraced open technology with religious fervor, Oracle’s approach had been strategic. Unlike Sun, Oracle possessed the financial strength and diversified business strategy to pursue high stakes litigation. It had done well in recent years pursuing copyright litigation against SAP and corporate takeovers.

In announcing the Sun acquisition, Ellison characterized Java as “the single most important software asset we have ever acquired” and touted Oracle’s Java-based middleware business, bolstered first by its BEA Systems acquisition and purchase of Sun, as being “on track to become as large as Oracle’s flagship database business.” Oracle would need to reposition Java’s licensing business to achieve that goal. Oracle’s leadership team sought to pursue a far more aggressive Java licensing strategy. It believed that the Sun products could bring in

---

$1.5 billion in operating profits in the first year following the acquisition.\textsuperscript{153}

The Sun acquisition was completed in early 2010.\textsuperscript{154} Oracle immediately approached Google about its use of Java in the Android platform. Google considered alternatives to Java,\textsuperscript{155} but ultimately stood its ground due to the lack of good work-arounds. For Oracle, the prospect of spending millions on attorneys’ fees and costs for even a modest possibility of sharing in the large and growing Android marketplace was a plausible, if not attractive, business proposition. Moreover, it could quickly establish Oracle as a key player in the lucrative, strategically important, and rapidly growing mobile operating system marketplace. Delay would only enhance Google’s laches and equitable estoppel defenses.

C. The Oracle v. Google Litigation

After six months of negotiations with Google, Oracle filed a broadside salvo alleging that Android infringed Java-related patents and copyrights in the Northern District of California in August 2010.\textsuperscript{156} With billions of dollars and control of two of the most important software platforms at stake, the parties would spare no expense in litigating the case over the next six years, with more battles yet to unfold.

The case was assigned to Judge William Alsup, a well-respected jurist who was not afraid of technologically complex subject matter.\textsuperscript{157} Judge Alsup actively managed the case with the goal of pushing the parties to settle the dispute or get to trial quickly. He pressured Oracle to streamline its patent allegations\textsuperscript{158} and rejected Google’s motion for summary judgment motion.

\textsuperscript{154} Antitrust authorities in the U.S. and Europe delayed the acquisition out of concern that Oracle, the leading relational database vendor, was acquiring a promising competing business (MySQL). \textsc{See} Sun acquisition by Oracle, https://en.wikipedia.org/wiki/Sun_acquisition_by_Oracle.

\textsuperscript{155} See email from Tim Lindholm to Andy Rubin (Aug. 6, 2010) (noting that Page and Brin had asked engineers to “investigate what technical alternatives exist to Java for Android and Chrome. We’ve been over a bunch of these, and think they all suck. We conclude that we need to negotiate a license for Java under the terms we need.”), http://www.fosspatents.com/2011/11/googles-five-failed-attempts-to-give.html.

\textsuperscript{158} See Oracle-Google trial to start on April 16, 2012, FOSS Patents (Mar. 13, 2012), Oracle offers withdrawal of three more patents in exchange for spring trial against Google, FOSS Patents (Mar. 9, 2012), http://www.fosspatents.com/2012/03/oracle-google-trial-to-start-on-
asserting that the API packages were uncopyrightable. While agreeing with Google that “the names of the Java language API files, packages, classes, and methods are not protectable as a matter of law” under the copyright doctrine denying protection for names and short phrases, the court nonetheless rejected Google’s broader argument that API declarations (beyond short phrases) and documentation are unprotectable under the *scenes a faire*, merger, or methods of operation (§ 102(b)) doctrines.

1. The 2012 Trial

Judge Alsup structured the trial in three phases: (I) copyright infringement claims; (II) patent infringement claims; and (III) all remaining issues, including damages and willfulness, if necessary. As the case wended its way toward trial, the core copyright allegations were boiled down to: (a) “12 Android files of source code (copied from 11 Java files), including rangeCheck”; (b) “Plain English descriptions in the user manual, sometimes called the API ‘specifications’”; (c) “37 APIs but only as to their specific selection, structure, and organization, it being conceded that the implementing code is different”; and (d) “Android’s entire source code and object code as derivative works of the 37 Java APIs.” The parties agreed that Judge Alsup would decide the copyrightability of the Java APIs and that the jury would decide copyright infringement, fair use, and whether any copying was de minimis. Thus, the most salient copyright issue raised by the Oracle-Google litigation—the copyrightability of APIs—was not going to be tried to the jury.

161 See U.S. Copyright Office, Material Not Subject to Copyright, 37 C.F.R. 202.1(a) (Copyright Office regulation denying copyright registration for “Words and short phrases such as names, titles, and slogans”); *Planesi v. Peters*, No. 04-16936, slip op. at *1 (9th Cir.Aug. 15, 2005); *Sega Enters. Ltd. v. Accolade, Inc.*, 977 F.2d 1510, 1524 n.7 (9th Cir. 1992) (“Sega’s security code is of such de minimis length that it is probably unprotected under the words and short phrases doctrine.”).
164 872 F.Supp.2d at 975.
As a result of Judge Alsup’s decision to reserve the copyrightability of APIs, the jury’s infringement verdict was largely a foregone conclusion. Judge Alsup instructed the jury that Oracle’s Java-related copyrights “cover the structure, sequence and organization [SSO] of the compilable code”\(^{165}\) and that Google “agrees that the structure, sequence and organization of the 37 accused API packages in Android is substantially the same as the structure, sequence and organization of the corresponding 37 API packages in Java.”\(^{166}\) Judge Alsup further instructed the jury that “[w]hile individual names are not protectable on a standalone basis, names must necessarily be used as part of the structure, sequence, and organization and are to that extent protectable by copyright”\(^{167}\)

Oracle’s principal copyright infringement argument boiled down to showing the jury a side-by-side comparison of Java and Android source code. Beyond its motion seeking a determination that the Java APIs are not copyrightable,\(^{168}\) Google’s principal path to a trial victory was that the jury would find that Android’s use of Java was permissible under the fair use doctrine.

Jury deliberations following the copyright phase of the trial ended with a partial Oracle victory.\(^{169}\) While finding Android infringed the 37 Java API packages in question taken as a group,\(^{170}\) the jury found that Google did not infringe Java documentation\(^{171}\) and that copying of

\(^{166}\) See id. at 10.

\(^{167}\) See id.

eight of the nine specific source code files at issue was de minimis. The jury hung on whether Google’s infringement of the Java API SSO constituted fair use. The jury split on the special interrogatories relating to Google’s equitable estoppel defense, holding that Sun/Oracle engaged in conduct that they knew or should have known would reasonably lead Google to believe that it would not need a license to use the Java API SSO, but that Google had not proven that it reasonably relied on such conduct.

The jury hung on whether Google’s infringement of the Java API SSO constituted fair use. The jury split on the special interrogatories relating to Google’s equitable estoppel defense, holding that Sun/Oracle engaged in conduct that they knew or should have known would reasonably lead Google to believe that it would not need a license to use the Java API SSO, but that Google had not proven that it reasonably relied on such conduct.

The patent phase of the trial commenced shortly after the jury rendered its copyright verdict. The same jury ruled that Google did not infringe the seven asserted claims of the two patents at issue. Therefore, the need for third phase of the trial hinged on Judge Alsup’s resolution of the post-trial copyright motions.

Shortly after the patent phase of the trial ended, Judge Alsup issued a detailed opinion holding that the Java APIs were not copyrightable, resulting in dismissal of the case. Although Judge Alsup cautioned that the ruling did not hold “Java API packages are free for all to use without license” or that “the structure, sequence and organization of all computer programs may be stolen,” the court held the “on the specific facts of this case [that] the particular elements replicated by Google were free for all to use under the Copyright Act.”

Judge Alsup grounded his decision in the particular and distinctive functional attributes of the 37 Java APIs and the fact that Google wrote its own implementing code. The principal

---

177 872 F.Supp.2d at 1002.

178 Google did include a small (9 lines of a 3,179 line function), “innocent,” and “inconsequential” segment of code (rangeCheck) in Android and eight test files that were never
copying concerned the lines of declaring code, which are necessary to operate the particular methods of the APIs. As Judge Alsup explained,

Significantly, the rules of Java dictate the precise form of certain necessary lines of code called declarations, whose precise and necessary form explains why Android and Java must be identical when it comes to those particular lines of code. That is, since there is only one way to declare a given method functionality, everyone using that function must write that specific line of code in the same way. 179

While acknowledging that the overall structure of the Java API packages is creative, original, and “resembles a taxonomy,” Judge Alsup nonetheless concluded that it functions as “a command structure, a system or method of operation—a long hierarchy of over six thousand commands to carry out pre-assigned functions.” 180 Applying copyright’s limiting doctrines as interpreted by Ninth Circuit cases 181 and following CONTU’s guidance that when specific

introduced into Android. See 872 F.Supp.2d at 982-83. The parties stipulated, however, that there were no damages associated with these relatively modest code portions so as to clear the way for appeal. See Final Judgment, Oracle Am., Inc. v. Google Inc., No. 3:10–cv3561 (N.D.Cal. June 20, 2012), ECF No. 1211.

179 872 F.Supp.2d at 979 (emphasis in original). See 872 F.Supp.2d at 981 (finding that “[i]n order to declare a particular functionality, the [Java] language demands that the method declaration take a particular form (emphasis in original)); id. at. 982 (finding that “the names of the methods and the way in which the methods are grouped” have to be the same in order to “be interoperable. Specifically, code written for one API would not run on an API organized differently, for the name structure itself dictates the precise form of command to call up any given method.”).

180 872 F.Supp.2d at 999-1000.

181 Judge Alsup placed particular emphasis on Sega Enters., Ltd. v. Accolade, Inc., 977 F.2d 1510 (9th Cir. 1992), for its rejection of the Third Circuit’s broad protection for the SSO of computer software, see Sega, 977 F.2d at 1524-25 (noting that “[t]he Whelan rule . . . has been widely—and soundly—criticized as simplistic and overbroad” (citing the Second Circuit’s decision in Computer Associates, Inc. v. Altai)), and its recognition of that “the functional requirements for compatibility with [a software platform developed by another company] are not protected by copyright. 17 U.S.C. § 102(b),” see Sega, 977 F.2d at 1522.

The Ninth Circuit expressly endorsed the Second Circuit’s Altai approach:

Under a test that breaks down a computer program into its component subroutines and sub-subroutines and then identifies the idea or core functional element of each, such as the test recently adopted by the Second Circuit in CAI, 23 U.S.P.Q.2d at 1252–53, many aspects of the program are not protected by copyright. In our view, in light of the essentially utilitarian nature of computer programs, the Second Circuit’s approach is an appropriate one.
computer instructions, “even though previously copyrighted, are the only and essential means of accomplishing a given task, their later use by another will not amount to an infringement.” Judge Alsup determined that Google was free to write code that accomplished the same functionality as the Java APIs at issue even if it did not achieve complete compatibility with the full Java platform. In essence, later developers can achieve the particular functionality or method of operation of an API subsystem (and even groups of subsystems) so long as they write their own code and that method is not protected by a patent.

Judge Alsup’s framework provided a general and concrete solution to the API copyright puzzle. Although he cautioned that his opinion was limited to the facts of the case and did not declare APIs uncopyrightable, Judge Alsup’s analysis illuminated a clear pathway for software developers seeking to use APIs defined and first implemented by other software companies without running afoul of copyright law. Later developers can legally use declaring code so long as they use a clean-room to implement the declarations. To many in the software industry, the ruling validated what was considered a best practice. To others, it jeopardized the substantial effort and investment in developing software platforms and pioneering products, and threatened to undermine interoperability.

2. Federal Circuit Reversal

Notwithstanding that Oracle did not appeal any patent issue, it filed its appeal with the U.S. Court of Appeals for the Federal Circuit. The Federal Circuit has exclusive jurisdiction over appeals from district court cases involving patent infringement allegations even though, as was the circumstance in Oracle v. Google, neither party challenged the district court’s patent rulings.

Sega, 977 F.2d at 1525 (emphasis added).
872 F.Supp.2d at 986 (quoting CONTU Report at 20 (emphasis added by Judge Alsup).
872 F.Supp.2d at 1000.
184 Patent protection, trade secret law, and contractual limitations could nonetheless stand in the way, but copyright protection could not bar re-implementation of functional features of computer programs.

185 See Nick Wingfield & Quentin Hardy, Google Prevails as Jury Rebuffs Oracle in Code Copyright Case, N.Y. TIMES (May 26, 2016) (quoting representatives of the Electronic Frontier Foundation, Public Knowledge, and a venture capital firm praising the jury’s verdict), http://www.nytimes.com/2016/05/27/technology/google-oracle-copyright-code.html; supra TAN

The Federal Circuit is bound by regional circuit law when reviewing questions that involve law and precedent not exclusively assigned the Federal Circuit. Thus, the Federal Circuit was required to review the copyright issues according to Ninth Circuit precedents.

The “software as creative expression” theme resonated with the Federal Circuit. The court’s opinion highlighted the creativity of Java APIs. The court pointed to the testimony of Joshua Bloch, the former Sun software engineer whom Google referred to as its “Java guru,” who “conceded” that there can be “creativity and artistry even in a single method declaration.” The Federal Circuit offered its own literary metaphor, noting that “the opening of Charles Dickens’ A TALE OF TWO CITIES is nothing but a string of short phrases. Yet no one could contend that this portion of Dickens’ work is unworthy of copyright protection because it can be broken into those shorter constituent components.”

The Federal Circuit reversed the district court’s determination that the structure, sequence, and organization of the 37 Java APIs were not copyrightable and remanded the fair use issue for re-trial with revised jury instructions. In reviewing the district court’s determination that the Java API packages at issue were not copyrightable, the Federal Circuit distinguished between copyrightability of the declaring code and copyrightability of the structure, sequence, and organization of the API packages. The Federal Circuit ruled that the district court should not have considered the merger and scènes à faire doctrines in evaluating copyright subsistence because the Ninth Circuit treats these doctrines as affirmative defenses to infringement, not as limitations on copyrightability. Hence, these doctrines were relevant only in determining what

---

188 Copyright issues are not exclusively assigned to the Federal Circuit. See 28 U.S.C. § 1295.
189 See 750 F.3d at 1352 (“Although [the district court] acknowledged that the overall structure of Oracle’s API packages is creative . . .”); id. at 1356 (“The testimony at trial revealed that designing the Java API packages was a creative process and that the Sun/Oracle developers had a vast range of options for the structure and organization.”); id. (“In its copyrightability decision, the district court specifically found that the API packages are both creative and original, and Google concedes on appeal that the originality requirements are met. See Copyrightability Decision, 872 F.Supp.2d at 976 (“The overall name tree, of course, has creative elements....”); Id. at 999 (“Yes, it is creative. Yes, it is original.”)); id. at 1361, n.6 (noting that the Amicus Brief filed by Scott McNealy and Brian Sutphin “provide[d] a detailed example of the creative choices involved in designing a Java package”); id. at 1368 (observing that “Amici McNealy and Sutphin explain that ‘a quick examination of other programming environments shows that creators of other development platforms provide the same functions with wholly different creative choices.’”).
190 750 F.3d at 1339.
191 750 F.3d at 1339.
192 See 750 F.3d at 1358 (citing Ets-Hokin v. Skyy Spirits, Inc., 225 F.3d 1068, 1082 (9th Cir. 2000); Satava v. Lowry, 323 F.3d 805, 810 n. 3 (9th Cir.2003) (“The Ninth Circuit treats
elements of the APIs should be filtered out in the infringement analysis. Furthermore, the Federal Circuit held that the merger doctrine—which bars protection where an idea can only be expressed in one or a limited number of ways—properly focuses on the creative choices available to Sun when it created Java, not on the options available to Google when it copied Java APIs. The Federal Circuit also held that the short phrases doctrine did not bar copyright protection for compilations of words and short phrases as reflected in declaring code. Consequently, the appellate court ruled that the 7,000 lines of declaring code were protected by copyright law.

The Federal Circuit faulted the district court’s reliance upon Lotus v. Borland, the First Circuit case holding that the Lotus 1-2-3 menu command hierarchy was an unprotectable “method of operation.” The Federal Circuit distinguished Lotus on factual grounds, noting that the command labels at issue there, unlike the Java API declaring code, were “not creative” and were “essential” to operating the computer system. Moreover, the Federal Circuit interpreted the Ninth Circuit’s cursory opinion in Johnson Controls, Inc. v. Phoenix Control Sys., Inc., to hold that the SSO of a computer program is eligible for copyright protection and hence was inconsistent with Lotus. In so doing, the Federal Circuit resurrected the flawed analysis in the Third Circuit’s Apple and Whelan cases: analyzing copyrightability of computer software based on whether the high level function(s) of the software could be implemented in multiple ways rather than viewing a particularized set of software functions as an unprotectable “method of operation.”

The Federal Circuit rejected the district court’s invocation of interoperability as a basis for holding the SSO of the Java APIs to be uncopyrightable. Notwithstanding the language in Sega and Sony v. Connectix that the precise coding to achieve interoperability is not protectable

---

193 See 750 F.3d at 1359-62 (addressing the merger doctrine); id. at 1363-64 (addressing the scènes à faire doctrine, which Judge Alsup had rejected as a basis for holding the Java APIs to be unprotectable but that Google challenged on appeal).
194 See 750 F.3d at 1360-61.
195 See 750 F.3d at 1362-63. It should be noted that the district court’s determination that the declaring code was uncopyrightable did not turn on the short phrases doctrine. Judge Alsup recognized that the selection and arrangement of short phrases could be protectable. See 872 F.Supp.2d at 992 (quoting Feist Publications, Inc. v. Rural Telephone Service Co., Inc., 499 U.S. 340, 349 (1991) for the proposition that even thinly protected, factual compilations are protectable with respect to original “selection and arrangement”). His ultimate determination turned on § 102(b) of the Copyright Act and interoperability. See id. at 997-1002.
197 See 750 F.3d at 1365.
198 886 F.2d 1173 (9th Cir. 1989).
199 See 750 F.3d at 1365-66. The Federal Circuit’s interpretation of Johnson Controls stretches its holding and overlooks important insights from later Ninth Circuit cases.
200 See 750 F.3d at 1366-67.
under copyright law, the appellate court distinguished these cases as “focused on fair use, not copyrightability.” The Federal Circuit held that “copyrightability is focused on the choices available to the plaintiff at the time the computer program was created,” not the defendant’s desire to achieve interoperability. Google’s interoperability argument comes into play only as part of a fair use defense.

The Federal Circuit leaned toward ruling in Oracle’s favor on fair use, noting that “[o]n many of [Oracle’s] points, Google does not debate Oracle’s characterization of its conduct, nor could it on the record evidence” and that “Google knowingly and illicitly copied a creative work to further its own commercial purposes, and did so verbatim, and did so to the detriment of Oracle’s market position.” Nonetheless, the Federal Circuit remanded because material facts were disputed, notably the transformativeness of the Android platform, Google’s interoperability objectives, and the commercial impact of Android on Sun’s/Oracle’s mobile licensing activities and the potential market for a Java smartphone. The Federal Circuit instructed the district court to “revisit and revise its jury instructions on fair use consistent with [the Federal Circuit’s] opinion.”

3. The Interlocutory Certiorari Petition

Rather than seeking en banc review of the Federal Circuit’s decision, Google filed a petition for a writ of certiorari with the U.S. Supreme Court. Google’s petition pressed the argument that the Java API declarations fall within the § 102(b) exclusion from copyright protection of methods of operation. Oracle responded that the case was not appropriate for interlocutory review on substantive and prudential grounds. The Supreme Court nonetheless

———

201 See Sega, 977 F.2d at 1525; Sony v. Connectix, 203 F.3d at 603 (“There is no question that the Sony BIOS contains unprotected functional elements.”).

202 See 750 F.3d at 1369 (observing that Sega and Sony never addressed whether the functional code had separable expressive elements). This assertion overlooks, however, that both courts recognized that the code that was necessary for interoperability was unprotectable and hence copying of the entirety of the software for purposes of reverse engineering the code to determine those interoperable features constituted fair use.

203 See 750 F.3d at 1370. The Federal Circuit follows the Third Circuit’s dicta—“a defendant’s desire ‘to achieve total compatibility . . . is a commercial and competitive objective which does not enter into the . . . issue of whether particular ideas and expressions have merged,’” id. (quoting Apple Computer, 714 F.2d at 1253)—and not the apparent rejection of that position in Sega and Sony. See Sega, 977 F.2d at 1525; Sony v. Connectix, 203 F.3d at 603.

204 See 750 F.3d at 1376.

205 See id. at 1377.

206 See id.

208 See Brief in Opposition, On Petition for a Writ of Certiorari to the United States Court
requested the views of the Solicitor General,\textsuperscript{209} which produced perhaps the case’s most surprising filing.\textsuperscript{210} The Solicitor General not only recommended against granting review on prudential grounds, but also sided with Oracle on substantive grounds.\textsuperscript{211} The Supreme Court denied review.\textsuperscript{212}

4. The 2016 Fair Use Retrial

The API copyright battle returned to Judge Alsup’s court for a jury trial focused on applying “the most troublesome [doctrine] in the whole law of copyright.”\textsuperscript{213} Google also planned to assert equitable estoppel and laches defenses.\textsuperscript{214} Oracle expanded the scope of its complaint to account for new Android versions, its expansion into new product areas (clothing, television, automobile, appliances, and media (Google Play)), and Android’s dramatic market growth.\textsuperscript{215}

Leading up to trial, the parties squabbled over the fair use jury instructions.\textsuperscript{216} After Judge Alsup adjusted the draft instructions based on input from the parties, one of the most
The trial played out over eight grueling days of testimony ranging from the dramatic (embarrassing emails) to the mind-numbing (experts and fact witnesses explaining API design, open source, GNU, GPL, virtual machines, and distinctions between declaring and implementing code). The jurors were treated to creative and strained analogies (filing cabinets, breakfast menus featuring hamburgers, and Harry Potter novels), all manner of demonstrative exhibits, and a witness list featuring some of Silicon Valley’s most celebrated billionaires. Economic experts opined about transformativeness (from an economic, as opposed to a legal, perspective) and network effects. Both sides made witnesses squirm. The connection of some lines of questioning to copyright law’s fair use factors was often tenuous. For example, Oracle devoted much of its trial time to exposing emails sent among Google engineers suggesting that they thought that the Java APIs were copyright-protected.

In view of the large stakes—Oracle sought upwards of $10 billion in damages and injunctive relief—both sides employed top-notch trial teams and spared little expense. Building upon the infringement ruling revived by the Federal Circuit, Oracle opened the second trial in rhythmic, Cochranesque fashion: Google copied the heart of the Java platform so as to enter the mobile marketplace quickly and now seeks to use the “fair use excuse” to avoid the consequences. Oracle emphasized internal e-mails show that Google took illegal “shortcuts” to create Android. Drawing on its successful Federal Circuit strategy, Oracle characterized the crafting of the Java API code as highly creative, whereas Google’s copying of Java APIs was slavish and not transformative. Oracle characterized the Android team’s decision to forgo a license as underhanded–breaking the Write Once, Run Anywhere interoperability promise.

Google responded by emphasizing its hard work and large investment in building a

---

219 The media and bloggers covered the trial closely. I have canvassed various sources, including: Joe Mullin’s reporting for ARS TECHNICA; Sarah Jeong Storify (Twitter feed of Sarag Jeong, a contributing editor @Motherboard), https://storify.com/sarahjeong; FOSS Patents (blog published by Florian Mueller, a self-described “intellectual property activist”), http://www.fosspatents.com/. I also reviewed many the exhibits that became publicly available, such as pleadings, jury instructions, and slide decks.
220 See Joe Mullin, Google took our property—and our opportunity, Oracle tells jury: “If that code wasn’t in their three billion phones, not one would work.” ARS TECHNICA (May 10, 2016), http://arstechnica.com/tech-policy/2016/05/oracle-tells-jury-dont-buy-googles-fair-use-excuse/.
transformative smartphone platform—bringing the functionality of robust web browsing, apps, and a host of other functionalities such as cameras and games (e.g., Angry Birds) to mobile devices.\textsuperscript{221} It justified use of Java based in part of Sun’s encouragement of the developer community to use Java and its APIs. Google downplayed the expressive creativity of Java APIs by analogizing the API packages to the labels on a filing cabinet.\textsuperscript{222} Google closed the trial by suggesting that transformativeness provides the sensible middle ground between stealing and free. “You don’t have to choose between commercial and transformative. . . . [b]ecause the whole purpose of fair use is to promote innovation.”

Following three days of deliberation, the jury found that Google had “shown by a preponderance of the evidence that its use in Android of the declaring lines of code and their structure, sequence, and organization from Java 2 Standard Edition Version 1.4 and Java 2 Standard Edition Version 5.0 constitutes a ‘fair use’ under the Copyright Act.”\textsuperscript{223} The verdict form did not ask the jury to make subsidiary factual findings.\textsuperscript{224} With fair use decided in Google’s favor, there was no need for a further damages phase. The jurors departed without comment, leaving the public and the appellate court without a clear understanding of how the fair use balance was struck. Judge Alsup rejected Oracle’s post-trial motions seeking judgment as a matter of law and a new trial based on alleged failure to comply with discovery responsibilities. Oracle plans to appeal the retrial to the Federal Circuit.

II. Critique of the Federal Circuit’s 2014 Copyrightability Decision

The Federal Circuit’s Oracle v. Google decision purports to apply Ninth Circuit jurisprudence in reviewing Judge Alsup’s decision holding that the compilation of functions and the structure, sequence, and organization of the Java APIs were not copyrightable. As I explore at length in a related project,\textsuperscript{225} the Federal Circuit misinterpreted §102(b) of the Copyright Act, misconstrued the Ninth Circuit’s software copyright jurisprudence, conflated expressive and

\end{itemize}
\end{footnotesize}
technological “creativity,” and applied an overly rigid approach to copyright law’s limiting doctrines. This section summarizes the main points.

A. Misinterpretation of the Copyright Act

The Federal Circuit’s opinion takes a broad view of the scope of copyright protection for computer software, emphasizing the low originality threshold. While recognizing the § 102(b) limitations, the court did not view those constraints as applicable to copyrightability. Rather, the court saw § 102(b) as only applying at the infringement and defenses stages of analysis.

The Federal Circuit misreads the clear language of the Copyright Act as well as the legislative history. Section 102(b) states that “[i]n no case does copyright protection for an original work of authorship extend to any idea, procedure, process, system, method of operation, concept, principle, or discovery, regardless of the form in which it is described, explained, illustrated, or embodied in such work.” A plain reading of the statute indicates that these exclusions apply at the copyrightability stage of analysis. They are also pertinent to infringement analysis and the fair use defense.

Google argued that the particular compilation of functions in Java API packages were uncopyrightable “method[s] of operation.” The Federal Circuit rejected the proposition that § 102(b) can be invoked in this way, quoting a comment in the legislative history of the 1976 Act stating that Section 102(b) “in no way enlarges or contracts the scope of copyright protection,” but merely “restates . . . that the basic dichotomy between expression and idea remains unchanged.”

That dichotomy traces back to the Supreme Court’s seminal decision in Baker v. Selden, which held that the owner of copyright disclosing a method of accounting could not bar others from using that the methods disclosed in the absence of patent protection.

---

226 See Oracle v. Google, 750 F.3d at 1356 (quoting Feist Publ’ns, Inc. v. Rural Tel. Serv. Co., 499 U.S. 340, 345, 358 (1991) (originality “means only that the work was independently created by the author (as opposed to copied from other works), and that it possesses at least some minimal degree of creativity”; “the originality requirement is not particularly stringent”).

227 Id. at 1354 (finding that the “district court failed to distinguish between the threshold question of what is copyrightable—which presents a low bar—and the scope of conduct that constitutes infringing activity.”)

228 Courts routinely apply the analogous separability analysis of the useful article doctrine at the copyrightability stage. See RISE OF THE API COPYRIGHT DEAD?, supra note __, at ___-

230 101 U.S. 99 (1879).

231 See id. at 102 (“To give to the author of the book an exclusive property in the art described therein, when no examination of its novelty has ever been officially made, would be a surprise and a fraud upon the public. That is the province of letters-patent, not of copyright. The
Supreme Court did not inquire into whether there were other methods that achieved the same
general purpose (bookkeeping). Rather, the Court categorically excluded any claim to a method
of accounting even as it ruled that Selden’s accounting book describing the method was
copyrightable.\textsuperscript{232} The CONTU Report concurs: “one is always free to make a machine perform
any conceivable process (in the absence of a patent)” so long as one does not “take another’s
program.”\textsuperscript{233}

In accordance with this principle, Google was entitled to make a mobile device (“a
machine”) perform the same functions as a Java API package (a “conceivable process”) with
clean-roomed computer code (not “another’s program”). Each Java API package constituted a
particular subsystem within a larger particular computing environment. Hence, Google was
justified in selecting a set of Java API packages and implementing them with original code to
create a new machine.

B. Misreading Ninth Circuit Jurisprudence

Beyond misconstruing § 102(b), the Federal Circuit’s opinion diverges from the clear
language and evolution of the Ninth Circuit’s software copyright jurisprudence. Judge Alsup
drew principally from the First Circuit’s \textit{Lotus} decision and the Ninth Circuit’s \textit{Sega}
decision in framing his analysis. The Federal Circuit held that the \textit{Lotus} decision is “inconsistent” with
Ninth Circuit precedent\textsuperscript{234} and that the \textit{Sega} decision is inapt.\textsuperscript{235} Neither of these interpretations,
however, withstands scrutiny.

Although the Ninth Circuit has not had occasion to specifically address the \textit{Lotus} line of
analysis, it holds that software that is necessary for interoperability is not copyrightable. In \textit{Sega
v. Accolade}, the Ninth Circuit stated that “the functional requirements for compatibility with the
Genesis [video game console are] aspects of Sega’s programs that not protected by copyright. 17
U.S.C. § 102(b).”\textsuperscript{236} Such aspects of the Genesis video game platform are functional

\textsuperscript{232} The Federal Circuit attempts to fit \textit{Baker v. Selden} into its atextual reading of § 102 by
stating that “The [Supreme] Court [in \textit{Baker v. Selden}] indicated that, if it is necessary to use the
forms Selden included in his books to make use of the accounting system, that use would not
amount to copyright infringement. See [\textit{Baker v. Selden}, 101 U.S. at 104] (noting that the public
has the right to use the account-books and that, ‘in using the art, the ruled lines and headings of
accounts must necessarily be used as incident to it’).” \textit{Oracle v. Google}, 750 F.3d at 1355. A
faithful reading of \textit{Baker v. Selden} recognizes that the Court held that the accounting method was
uncopyrightable, not merely not infringed. That is the essence of the idea-expression dichotomy.

\textsuperscript{233} See \textit{CONTU FINAL REPORT} at 20.
\textsuperscript{234} \textit{Oracle v. Google}, 750 F.3d at 1365.
\textsuperscript{235} \textit{Oracle v. Google}, 750 F.3d at 1369.
\textsuperscript{236} \textit{Sega Enterprises v. Accolade, Inc.}, 977 F.2d 1510, 1522 (9th Cir. 1992).
specifications of the computer system—a relatively simple API. The Ninth Circuit unequivocally ruled that the interface specification was not copyrightable, which parallels the *Lotus* analysis. The Ninth Circuit could not have cited the First Circuit’s *Lotus* decision because that decision was not handed down until several years later.

Not only did the Federal Circuit misread the Ninth Circuit’s *Sega* and *Sony* decisions, it embraced lines of analysis that the Ninth Circuit has expressly rejected. By holding that the code for interoperability may be protectable, the Federal Circuit resurrects the Third Circuit’s dicta in *Apple v. Franklin*: “courts have recognized that, once the plaintiff creates a copyrightable work, a defendant’s desire ‘to achieve total compatibility . . . is a commercial and competitive objective which does not enter into the . . . issue of whether particular ideas and expressions have merged.’” To the contrary, the Ninth Circuit holds that copyright law does not stand in the way of achieving interoperability. As noted earlier, the Third Circuit comment is dicta as Franklin Computer had copied the entirety of Apple’s computer programs. More importantly, § 102(b), the CONTU Report, and the *Sega/Sony* decisions directly contradict the Third Circuit’s proposition.

Moreover, the Federal Circuit endorsed and followed the Third Circuit’s *Apple/Whelan* framework, holding that everything not necessary to the general purpose or function of a work is protectable expression: “We agree with Oracle that, under Ninth Circuit law, an original work—even one that serves a function—is entitled to copyright protection as long as the author had multiple ways to express the underlying idea.” The Federal Circuit credited Oracle’s statement that it only claimed “its particular way of naming and organizing each of the 37 Java API packages” and that it “cannot copyright the idea of programs that open an internet connection,” but ‘it can copyright the precise strings of code used to do so, at least so long as “other language is available” to achieve the same function.’ In an accompanying footnote, the court noted that Oracle’s counsel explained at oral argument that Oracle “would never claim that anyone who uses a package-class-method manner of classifying violates our copyright. We don’t own every conceivable way of organizing, we own only our specific expression—our specific way of naming each of these 362 methods, putting them into 36 classes, and 20 subclasses.” The Federal Circuit reasoned that as long as the same general functions could be accomplished using

---

237 See *Oracle v. Google*, 750 F.3d at 1357.
238 See, supra TAN 
239 See *Oracle v. Google*, 750 F.3d at 1371 (quoting *Apple Computer, Inc. v. Franklin Computer Corp.*, 714 F.2d 1240, 1253 (3rd Cir. 1983)); see also id. at 1366 (noting that the Third Circuit in *Apple v. Franklin* “focused ‘on whether the idea is capable of various modes of expression’ and indicated that, ‘[i]f other programs can be written or created which perform the same function as [i]n Apple’s operating system program, then that program is an expression of the idea and hence copyrightable’” (quoting *Apple Computer, Inc. v. Franklin Computer Corp.*, 714 F.2d 1240, 1252 (3d Cir. 1983)).
240 See *Oracle v. Google*, 750 F.3d at 1367-68 (emphasis in original; internal quotations from Oracle’s Reply Brief).
241 Id., at n.13.
While this mode of analysis comports with Ninth Circuit jurisprudence with regard to implementing code, it contradicts copyright law principles and Ninth Circuit precedent as regards declarations that are necessary to operate a particular computing system. Contrary to the Third Circuit’s dicta in *Apple v. Franklin*, the Ninth Circuit’s *Sega* and *Sony* decisions hold that the code necessary for interoperability is uncopyrightable. Thus, a defendant’s desire to achieve compatibility does enter into the issue of whether particular ideas and expressions have merged in the Ninth Circuit. It resolves the issue so long as the defendant independently writes the code to achieve the particular functions of the plaintiff’s software. Secondly, the *Sega* decision unequivocally rejects the *Whelan* framework of simply asking whether there are multiple ways of programming a particular function: “[t]he *Whelan* rule . . . has been widely—and soundly—criticized as simplistic and overbroad.” (citing the Second Circuit’s decision in *Computer Associates, Inc. v. Altai*), and its recognition of that “the functional requirements for compatibility with [a software platform developed by another company] are not protected by copyright. 17 U.S.C. § 102(b),” see *Sega*, 977 F.2d at 1522.

**C. Conflation of Expressive and Technological “Creativity”**

The Federal Circuit embraced Oracle’s argument (and that of former Sun executives)

---

242 *See Oracle v. Google*, 750 F.3d at 1356 (setting the foundation for its analysis by observing that “the Sun/Oracle developers had a vast range of options for the structure and organization” of the Java APIs); id. at 1360 (“We have recognized, . . ., applying Ninth Circuit law, that the ‘unique arrangement of computer program expression . . . does not merge with the process so long as alternate expressions are available.’ *Atari*, 975 F.2d at 840.”); id. (explaining that “[b]ecause Nintendo produced expert testimony ‘showing a multitude of different ways to generate a data stream which unlocks the NES console,’ we concluded that Nintendo’s specific choice of code did not merge with the process.”); id., n.5 (noting that “[i]t is undisputed that Microsoft and Apple developed mobile operating systems from scratch, using their own array of software packages.”); id. at 1368, n.14 (referencing the amicus brief of former Sun executives explaining that “a quick examination of other programming environments [Apple’s iOS and Microsoft Windows Phone] shows that creators of other development platforms provide the same functions with wholly different creative choices.”).

243 *See Sega*, 977 F.2d at 1522 (holding that “the functional requirements for compatibility with [a software platform developed by another company] are not protected by copyright. 17 U.S.C. § 102(b).”).

that API design is a “creative,” “noble craft” entitled to robust protection. Oracle’s analogized API design to the crafting of *Harry Potter* novels.

This argument, however, conflates idea and expression. APIs function as the levers and gears of particular digital machines. The declarations must be reproduced to replicate the particular functionality. Android programmers needed to reproduce the same package, class, and method names to effectuate a computer that responds to the same inputs and produces the same outputs as Java API packages.

Protection for a particular combination of functions effectively monopolizes that technological solution. The digital revolution has taught that once consumers and programmers become accustomed to a particular interface specification, robust intellectual property protection for APIs can have dramatic effects on competition and innovation. The Supreme Court and Congress have determined that inventors must meet the patent law’s higher thresholds of novelty, non-obviousness, and disclosure to garner protection for technological creativity. Furthermore, patent protection is limited to 20 years from the filing of the application, far less than copyright law’s 95 year duration for corporate authors.

**D. Overly Rigid Approach to Limiting Doctrines**

The Federal Circuit errs by attempting to shoehorn analysis of API design into a framework designed for analyzing software code. As the *Lotus* court and Judge Alsup recognized, copyright law does not dictate a monolithic approach to all media. Copyright law has long relied upon a common law approach for adapting the law to deal with new technologies and other dynamic considerations. The idea-expression dichotomy provides flexibility in the domain of functional works. Courts need to be sensitive to technological nuance in applying § 102(b) and evolving the family of doctrines (merger, scènes à faire, *Baker v. Selden*, and fair use) on which it is based.

*Oracle v. Google* is the first litigated copyright case since *Lotus* to focus specifically on

---

247 See, supra, TAN; *Oracle v. Google*, 750 F.3d at 1356 (citing the district court’s *Copyrightability Decision* for the proposition that “[t]he overall name tree [of the Java API, of course, has creative elements”).

248 See generally CARL SHAPIRO & HAL R. VARIAN, INFORMATION RULES: A STRATEGIC GUIDE TO THE NETWORK ECONOMY 103-226 (1999); Menell, *supra* note __ <Tailoring Legal Protection for Computer Software>.

copyright protection for API design. Judge Alsup saw that although the Ninth Circuit had endorsed the Altai framework for cases involving implementing code, the Oracle v. Google case required an alternative framework to address API design. He recognized that the Lotus case provided pertinent analysis and that the Sega case addressed the uncopyrightability of code necessary for interoperability. His decision thoughtfully combined these elements to produce a sound framework.

The scope of protection for computer software brought new issues to the fore. When Sega developed its lock-out code for the Genesis game console, there were no constraints on the arbitrary string characters that it designated for the key. Just as bank customers are unconstrained in choosing their PIN codes (within the field constraint of four numbers), Sega was free to choose an arbitrary string of letters, numbers, and symbols to lock and unlock its platform. The Ninth Circuit nevertheless determined that § 102(b) did not protect the lock-out code because once it was “created” for use as lock-out code, it became functional.

The First Circuit reached a similar conclusion in the Lotus case. At the time that Lotus designed its menu command hierarchy for the Lotus 1-2-3 program, there were numerous options for labeling the functions and countless compilations of function names. Once programmers learned those function names, however, the labels took on tremendous importance to the user community. To bestow copyright protection on such a system would potentially confer tremendous market power over the particular method of operating a spreadsheet due to users’ high switching costs—many had developed sophisticated macros for automating their accounting and other record keeping. The First Circuit recognized that this issue was best addressed at the copyrightability stage. Like Selden’s accounting book, Lotus’s spreadsheet program was entitled to copyright protection at the moment it was created (or in the case of Selden’s book, when the applicable formalities at the time were met) but the method of operation (like Selden’s accounting system) remained outside of copyright protection.

Although more sophisticated than an ATM PIN code, the Genesis lock-out code, or Lotus’s menu command hierarchy, the declarations of the Java APIs similarly functioned as methods of operating particular digital machines—packages of functions. Judge Alsup’s focus on

250 As noted above, the Sega case addressed this issue as part of a fair use analysis of intermediate copying of software code. See, supra TAN __-. This API design issue has, however, arisen in litigation contexts, but was not resolved by judicial decisions. As noted earlier, I advised Sun Microsystems about these issues during their Java-related breach of contract and copyright infringement litigation with Microsoft in the late 1990s. I also testified about these issues in an arbitration proceeding applying Ninth Circuit law in 200_. The arbitration panel interpreted Ninth Circuit law very similarly to Judge Alsup and found the declaring code (header files) at issue in that case to be uncopyrightable. (I served as a consultant in the Sun matter and as an expert witness in the Green Hills matter. In contrast to my amicus briefs, I was compensated by the parties that retained me in these matters. My testimony reflected my writings on legal protection for computer software.)

251 See Copyrightability Decision, 872 F.Supp.2d at 984-97.
§ 102(b) and the *Lotus* court’s framework better address the copyright issues in *Oracle v. Google* than the *Altai* framework, which was developed for analyzing copyright code.

By rigidly focusing on Ninth Circuit cases that treat the merger and scènes à faire doctrines as defenses to infringement rather than copyrightability doctrines, the Federal Circuit missed the forest for the trees. Section 102(b) can operate as both a threshold doctrine and as part of the filtration step of infringement analysis. In fact, in the *Ets–Hokin* case, on which the Federal Circuit bases its analysis, the Ninth Circuit treats the bottle that is the object of the photograph in question as uncopyrightable under the useful article doctrine, i.e., at a threshold copyrightability level. Copyright law, like the patent law’s non-obviousness doctrine, does not fit a rigid mold.

E. Treating API Design as Variable Expression Rather than Unique Function

The Federal Circuit erred in treating the set of 37 Java API declarations as “source code” rather than as the functional specifications for a particular computer system. Such API design defines the particular data processing capabilities of a particular computing machine and is necessary for another virtual machine to perform the same processes.

From a copyright standpoint, the critical question is whether a particular set of instructions, expressed in a particular way, is “the only and essential means of accomplishing a given task.” Alternatively, are these particular instructions, expressed in this particular way, the only way to effectuate “the actual processes or methods embodied in the program”? As CONTU explained, “one is always free to make a machine perform any conceivable process (in the absence of a patent) so long as one does not “take another’s program.” The test is not whether there are multiple ways of writing code to perform a general purpose. Congress viewed the idea-expression dichotomy as enabling anyone to build a machine capable of performing any particular function, including those for which others had written computer code. Under the idea-

---

252 The Federal Circuit cites to *Ets–Hokin v. Skyy Spirits, Inc.*, 225 F.3d 1068, 1073, 1082 (9th Cir. 2000) (involving photography), and *Satava v. Lowry*, 323 F.3d 805, 810 n.3 (9th Cir. 2003) (involving glass-encased jellyfish sculptures; holding that “[t]he Ninth Circuit treats scenes a faire as a defense to infringement rather than as a barrier to copyrightability”).

253 See *Ets–Hokin v. Skyy Spirits, Inc.*, 225 F.3d 1068, 1073, 1080 (9th Cir.2000)

255 See 750 F.3d at 1368 (“Given the [district] court’s findings that the SSO is original and creative, and that the declaring code could have been written and organized in any number of ways and still have achieved the same functions, we conclude that Section 102(b) does not bar the packages from copyright protection just because they also perform functions.”).

256 See CONTU FINAL REPORT at 20.

257 See H.R. REP. No. 1476, 94th Cong., 2d Sess. at 57.

258 See CONTU FINAL REPORT at 20.
expression dichotomy, copyright protection must not lock competitors out of a particular platform; only patent protection can. Copyright protection can only require that competitors write their own implementing code. If the only way to achieve such “certain result”\(^\text{259}\) includes literally copying even detailed textual-represented information—such as declarations—then copyright law does not stand in the way.

Google followed this path. It sought to achieve the particular functionalities of 37 Java API packages. After negotiations to license the Java APIs reached an impasse, Google independently wrote its own implementing code. Oracle does not dispute that Google needed to include the particular declarations to make its Android platform perform the particular functions of the 37 Java APIs. Thus, the Federal Circuit should have affirmed Judge Alsup’s copyrightability ruling and the case should have ended at that stage.

III. The Oracle v. Google Litigation: Future Pathways

The Oracle v. Google fair use jury trial ranks among the most significant computer software intellectual property trials and copyright fair use trials in U.S. history. Yet, it did little to clarify intellectual property protection for computer software. Even though Google has prevailed thus far, the jury’s fair use decision has little precedential significance. The jury’s verdict in Oracle v. Google does not insulate other technology companies from the risk of copyright liability for independently implementing the code necessary to achieve particular functionality. Nor does it stand in the way of Oracle filing a new complaint alleging that new versions of Android infringe copyright protection for the structure of Java API packages. The only secure safe harbors are to develop an independent platform or license the pre-existing APIs.

Thus, notwithstanding six years of litigation and two trials, the Oracle v. Google litigation has contributed to, rather than quelled, confusion surrounding API copyright protection. Fair use is a highly unpredictable area of law. Legal advisors will need to inform clients that there is no clear safe harbor for re-implementing APIs short of a license. Other trial teams will face the same troublesome doctrines in the context of other sets of complex facts.

Furthermore, by resolving the fair use question by a simple jury verdict form,\(^\text{260}\) the Oracle v. Google litigation sheds little light on the reasoning on which the jury based its decision. There were no formal factual findings. Therefore, the decision contributes little to our understanding of the fair use factors—transformativeness, commerciality, nature of the copyrighted work—or how they are balanced in the context of APIs. All we know is that Google’s particular re-implementation for particular devices was fair use. As the motion for a new trial

\(^{259}\) As added in the 1980 amendments, the Copyright Act defines a “computer program” as “set of statements or instructions to be used directly or indirectly in a computer in order to bring about a certain result.” 17 U.S.C. § 101.

\(^{260}\) See Notice of Final Charge to the Jury (Phase One) and Special Verdict Form (Document 1928, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA).
reveals,\textsuperscript{261} however, new versions of the Android platform could provide the basis for a new copyright infringement action.

Such uncertainty can be especially problematic for technology companies. The design of a new platform requires planning. As we know from network economics, the viability and value of a platform depends critically upon its ability to leverage consumers’ and programmers’ familiarity with APIs.\textsuperscript{262} Yet the current status of API copyright jurisprudence hinges liability for copyright infringement on “‘the most troublesome [doctrine] in the whole law of copyright.’”\textsuperscript{263}

As the \textit{Oracle v. Google} litigation has already illustrated, a jury verdict does not necessarily resolve a dispute, especially in a case in which the cost of appeal is relatively low in comparison with the stakes involved and the parties don’t perceive advantages to settlement.\textsuperscript{264} Fair use remains “‘the most troublesome [doctrine] in the whole law of copyright.’”\textsuperscript{265} As Google completed its case in chief, Oracle filed a motion requesting that Judge Alsup render judgment as a matter law (“JMOL”).

Judge Alsup rejected Oracle’s JMOL motion.\textsuperscript{266} Judge Alsup explained that he erred on Oracle’s side in allowing an instruction on the propriety of the defendant’s conduct\textsuperscript{267} notwithstanding that the Federal Circuit did not call attention to this consideration in its remand decision and the Supreme Court’s decision in \textit{Campbell v. Acuff-Rose Music, Inc.} downplays or jettisons this consideration.\textsuperscript{268} He further explained that based on the evidence presented, the jury

PROBS.} 263, 263 (2003).

\textsuperscript{267} See Notice of Final Charge to the Jury (Phase One) and Special Verdict Form, at § 27 (Document 1928, Oracle America, Inc. v. Google Inc. 3:10-cv-03561-WHA).

\textsuperscript{268} See 510 U.S. 569, 585 n.18 (1994) (“Even if good faith were central to fair use, 2 Live Crew’s actions do not necessarily suggest that they believed their version was not fair use; the offer [to license the plaintiff’s work] may simply have been made in a good-faith effort to avoid this litigation. If the use is otherwise fair, then no permission need be sought or granted.”); 2
could well have determined that it was fair use to maintain the same structure of 37 Java API packages in the Android re-implemented packages so as to avoid the confusion that would ensue from scrambling the various functions: “avoiding cross-system babel promoted the progress of science and useful arts — or so our jury could reasonably have found.”  

Judge Alsup rejected Oracle’s arguments that Android’s use of the Java APIs should have been deemed “entirely commercial” and non-transformative, and that the Java APIs should have been considered “highly creative” because of the myriad ways in which the functions could have been implemented. With respect to the fourth fair use factor—the impact on the potential market for the Java platform—Judge Alsup ruled that the jury “could reasonably have found that use of the declaring lines of code (including their SSO) in Android caused no harm to the market for the copyrighted works, which were for desktop and laptop computers” and that the copying had little effect on licensing of Java ME beyond “the tailspin already predicted within Sun.”  

The court concluded its ruling by highlighting the contradiction between Oracle’s pretrial instruction arguments—focusing on characterizing the fair use test as an equitable rule of reason affording juries broad discretion based on the contextual facts of the case—and its JMOL motion urging that the court override the jury’s balancing of the fact-specific factors:

In applying an ‘equitable rule of reason,’ our jury could reasonably have given weight to the fact that cross-system confusion would have resulted had Google scrambled the SSO and specifications. Java programmers and science and the useful arts were better served by a common set of command-type statements, just as all typists are better served by a common QWERTY keyboard.  

That decision did not, however, end even the trial court phase of the litigation. Oracle filed a new JMOL motion in early July that critiqued Judge Alsup’s rejection of its first JMOL motion. More significantly, Oracle filed a motion requesting a new trial based on Google’s alleged failure to disclose its plan to install Android Marshmallow on desktop and laptop computers. In its reply to Google’s opposition, Oracle contended that the withheld evidence

\(^{278}\) See Oracle v. Google: jury finds in favor of “fair use,” as no reasonable, properly-instructed jury could have (May 26, 2016) (contending that Judge Alsup’s instructions set the fair use bar far too low) http://www.fosspatents.com/2016/05/oracle-v-google-jury-finds-in-favor-of.html; but see Jonathan Band, Sanity Prevails Again, Part II: The District Court Leaves the Oracle v. Google Fair Use Verdict in Place, Disruptive Competition Project (Jun. 10, 2016) (contending that “given how the district court meticulously found evidence in the record supporting the reasonableness of the jury’s fair use finding, it is hard to imagine that the Federal Circuit will reverse it”), http://www.project-disco.org/intellectual-property/061016-sanity-prevails-again-part-ii-the-district-court-leaves-the-oracle-v-google-fair-use-verdict-in-place/#.V7sha_krJph

\(^{279}\) See U.S. Court of Appeal for the Federal Circuit Internal Operating Procedures, Rule #3 (Merits Panels–Distribution of Briefs, Records, and Files (Nov. 14, 2008) (“When an appeal is docketed in a case that was previously remanded by this court . . . the clerk’s office attempts to assign the appeal to the previous panel, to a panel including at least two members of the previous panel (if one of those members was the authoring judge), or to a panel that contains the authoring judge, if such a panel is otherwise constituted and available on a subsequent argument calendar.”)), http://www.cafc.uscourts.gov/sites/default/files/IOPs122006.pdf.
mock trial. It can potentially improve some of its themes and better prepare its witnesses. Moreover, Google will be prevented from asserting one of its key arguments—that Android is not a substitute for Java SE on personal computers. Alternatively, Google might decide to redesign its Chrome integration with Android so as to work-around the 37 Java APIs. But even if Google does so, its fair use argument may be diminished, especially if it integrates its mobile and desktop platforms. The appellate panel has already indicated that there was much force to Oracle’s position and that many of the facts relevant to the fair use balance were not in dispute.  

Google also has reason for optimism. First, it won the jury trial after Judge Alsup modified the jury instructions in light of the parties’ concerns. Second, even if Google were to lose at the Federal Circuit level a second time, it might be able to get the Federal Circuit’s API copyrightability ruling reviewed by the Supreme Court,281 which would be of tremendous importance to expanding Android’s reach and removing the cloud of further infringement lawsuits.

Assuming that the parties cannot reach a settlement, the Federal Circuit will review the fair use trial and post-trial rulings. Should Google prevail, Oracle would likely take a shot at Supreme Court review. Google would have the option of reasserting the copyrightability issue. Alternatively, the Federal Circuit could remand for another fair use trial or resolve the ultimate fair use question in Oracle’s favor, thereby setting up a Google writ of certiorari petition raising both API copyrightability and fair use questions. Thus, under the most optimistic scenario, the case will drone on for several more years.

IV. Debugging Appellate Intellectual Property Jurisdiction

The unusual jurisdictional posture of the Oracle v. Google case highlights an overlooked defect of appellate intellectual property jurisdiction. When Congress established the Court of Appeals for the Federal Circuit in 1982, it sought to address confusion in patent jurisprudence and the forum shopping that it generated.282 Legislators did not, however, provide a procedure for reviewing Federal Circuit interpretations of regional circuit law short of Supreme Court review. Forum shopping motivated by conflicting regional circuit patent jurisprudence dominated the policy discussion. By contrast, computer software litigation was in its infancy and the patentability of computer software was in flux.283 Thus, it is not surprising that Congress did not put in place the types of checks and balances that might be needed to avoid or limit

280 See 750 F.3d at 1376.
281 See Google’s Trial Brief, Oracle America, Inc. v. Google Inc., at 8, n.12 (Document 1706, 3:10-cv-03561-WHA) (“Google does not waive and hereby expressly preserves its position that the SSO/declarations are not protected by copyright law. See, e.g., Bikram’s Yoga Coll. of India, L.P. v. Evolation Yoga, LLC, 803 F.3d 1032 (9th Cir. 2015).”).
282 See infra TAN __.
jurisprudential confusion in non-patent aspects of the Federal Circuit’s jurisdiction.

With the emergence of both software patenting and copyright protection for computer software, it was only a matter of time before Federal Circuit and regional circuit copyright jurisprudence would intersect. The Oracle v. Google case illustrates the “forking” of Ninth Circuit copyright jurisprudence. Whereas Judge Alsup placed principal reliance on the Ninth Circuit’s Sega decision, which expressly rejected the Whelan framework, the Federal Circuit emphasized the Nintendo v. Atari Games decision, a prior Federal Circuit decision applying Ninth Circuit law. That decision predates Sega and builds on the inchoate foundation of the Ninth Circuit’s Johnson Controls decision.

The Oracle v. Google litigation reveals the jurisprudential confusion that can arise from surrogate interpretation of judicial decisions. En banc review provides a mechanism for addressing intra-circuit splits. The only en banc process available for Google, however, would have been at the Federal Circuit. It is understandable why Google chose to pursue a writ of certiorari at the Supreme Court rather than en banc review. It is unlikely that the Federal Circuit would have seen review of a unanimous panel decision interpreting regional circuit law as justifying the significant organizational resources of en banc review. Furthermore, such review could have jeopardized collegiality among Federal Circuit jurists on questions that are outside of the Federal Circuit’s principal jurisprudence.

The Federal Circuit’s expansive view of API copyrightability in conjunction with the jurisdictional misalignment has been costly for Google and the larger software industry. Google has now endured a second costly trial and has had to pursue its business and technology strategy under a cloud of confusion about the copyrightability of the functions and labels within API packages. The greater software industry has endured continued uncertainty about the state of a critical aspect of copyright law.

There are several approaches for fixing this bug in the appellate jurisdictional system. There is no justification for routing appeals of non-patent issues governed by regional circuit law to the Federal Circuit when patent issues are not appealed. But were Congress to amend the Federal Circuit’s jurisdiction so that such appeals would go to the regional circuit, patent owners could easily circumvent that rule by appealing patent issues that they might otherwise drop solely for the purpose of getting non-patent issues to the Federal Circuit. More significantly, there are many patent cases with non-patent issues for which patent and non-patent issues merit appeal.

---

284 Forking of software code refers to creating an independent branch of a computer program. See Fork (software development), https://en.wikipedia.org/wiki/Fork(software_development). This split from the original program typically “spawns competing projects that cannot later exchange code, splitting the potential developer community.” See Eric S. Raymond, Promiscuous Theory, Puritan Practice, in Homesteading the Noosphere (2002), http://www.catb.org/~esr/writings/cathedral-bazaar/homesteading/ar01s03.html

285 897 F.2d 1572 (Fed. Cir. 1990).
Hence, the allocation of appellate jurisdiction over cases raising patent and non-patent issues will arise.

Section A traces the legislative intent underlying the Federal Circuit’s subject matter jurisdiction. Section B develops a framework for assessing appellate intellectual property jurisdiction. Section C applies that framework to assess appellate intellectual property jurisdictional regimes.

A. The Federal Circuit’s Subject Matter Jurisdiction

The establishment of the Federal Circuit grew out of general concern about the federal judiciary’s ability to keep pace with the demands of a growing nation, global economy, and ever-expanding and increasingly complex set of laws. Federal dockets had grown significantly in the 1960s and there was widespread concern about the strain on all levels of the federal judiciary.286

In 1972, Congress established the Commission on Revision of the Federal Court Appellate System, Structure and Internal Procedure to study the functioning of the appellate courts and make reform recommendations.287 The Commission proposed, among other measures, the establishment of a National Court of Appeals.288 The Commission also called attention to the problem of forum shopping in the patent field,289 but did not recommend creation of a specialized court for patent appeals.290

Growing concerns about economic stagnation led President Carter’s Domestic Policy Review on Industrial Innovation to pursue a specialized patent appellate court as a means of

289 See id. at 220-21 (quoting Judge Henry Friendly describing “mad and undignified races between a patentee who wishes to sue for infringement in one circuit believed to be benign toward patents, and a user who wants to obtain a declaration of invalidity or non-infringement in one believed to be hostile to them,” citing HENRY FRIENDLY, FEDERAL JURISDICTION: A GENERAL VIEW 155 (1973)).

290 See id. at 234-36. The Commission believed that its proposed National Court of Appeals would better address the patent forum shopping concerns.
Advocates for a specialized patent appellate court believed that jurisprudential divisions among the regional courts of appeal undermined investment and innovative activity. Many jurists, legislators, and key bar associations resisted the creation of a specialized patent tribunal, largely on the grounds that general jurists and regional courts best serve the administration of justice. Supporters of consolidating patent appeals in a single tribunal countered that the proposed appellate tribunal, which merged appellate responsibilities for claims against the government, trade matters, and several other areas with appeals of patent cases belied the “specialized court” label. The proposed court would have a range of responsibilities and include generalist judges.

---

292 See H. REP. 96-1307, 96th Cong., 2d Sess. (1980) (diagnosing the root causes of economic stagnation as the “failure of American industry to keep pace with the increased productivity of foreign competitors” and explaining that a single court for patent appeals “will do a great deal to improve investors’ confidence in patented technology”).

293 See George C. Beighley Jr., The Court of Appeals for the Federal Circuit: Has it Fulfilled Congressional Expectations? FORDHAM INTELL. PROP., MEDIA, & ENT. L.J. 670, 689-90, 693-97 (2011); see also Additional Views of Senator Max Baucus on S. 1700--the Federal Courts Improvements Act of 1981, S. REP. 97-275, Appendix B (noting that “the American Bar Association and the American College of Trial Lawyers have actively opposed that portion of S. 1700 that would remove patent appeals jurisdiction from the eleven federal circuit courts of appeals. They share my concern that creating such a specialty court is not in the best interest of the legal system.”); Randall R. Rader, An Open Letter from Judge Rader, PatentlyO (Jun. 30, 2014) (in farewell letter to his colleagues on the Federal Circuit, Chief Judge Randall Rader expressed his regret that as a Senate Judiciary Committee staffer in the early 1980s, he “allowed judges from the Ninth Circuit to dissuade [him] from offering an amendment to include copyright and trademark cases within the jurisdiction of the Federal Circuit”), http://patentlyo.com/patent/2014/06/letter-judge-rader.html.

The counter-argument carried the day. Congress passed the Federal Courts Improvement Act of 1981\(^{295}\) establishing a new Article III appellate tribunal: the U.S. Court of Appeals for the Federal Circuit. Nonetheless, legislators circumscribed the Federal Circuit’s exclusive jurisdiction so as to preserve regional circuit court primacy with respect to non-patent areas of law.

Congress voiced concern about the Federal Circuit expanding its exclusive patent jurisdiction to other areas, such as antitrust law. The Senate Judiciary Committee noted the risk and specifically warned against the Federal Circuit’s exclusive jurisdiction over patent claims being manipulated or extended. The Senate Report explained that the establishment of the Federal Circuit

is intended to alleviate the serious problems of forum shopping among the regional courts of appeals on patent claims by investing exclusive jurisdiction in one court of appeals. \textit{It is not intended to create forum shopping opportunities between the Federal Circuit and the regional courts of appeals on other claims}.\(^{296}\)

The Committee noted that

If, for example, a patent claim is manipulatively joined to an antitrust action, but severed or dismissed before final decision of the antitrust claim, jurisdiction over the appeal of the antitrust claim should not be changed by this Act but should rest with the regional court of appeals.\(^{297}\)

Senator Leahy specifically warned that “[i]n nearly all . . . litigation [other than patent cases], science and technology, when relevant, are related to other human or social issues, and only a generalist court should ever hear such matters.”\(^{298}\)

Congress did not, however, clearly foresee the potential for jurisprudential confusion and forum shopping that could arise from the Federal Circuit’s interpretation of regional circuit law. The potential for cases raising both patent and copyright questions would have seemed remote at the time that the Federal Circuit was crafted. Software litigation was in its infancy at the time, with substantial questions about the patent eligibility of computer software.\(^{299}\) Even as software

\(^{296}\) See S. REP. 97-275 (1981); see also H. REP. 96-1307 (stating that “jurisdiction of an appeal in a case involving a claim arising under any Act of Congress relating to copy rights or trademarks . . . will continue to go to the regional appellate courts, pursuant to section 1294 of title 28”).
\(^{298}\) See Additional Views of Senator Patrick J. Leahy on S. 1700, S. Rep. 97-275, Appendix B.
\(^{299}\) See supra note ___ <citing Flook>.
patenting expanded in the mid to late 1990s, the decline of software copyright litigation meant that complaints asserting both patent and copyright causes of action were rare.

The Federal Circuit’s 2014 Oracle v. Google decision manifests legislators’ fears of overreach. The Federal Circuit’s questionable interpretation of Ninth Circuit copyright law now motivates software intellectual property owners to bundle patent and copyright claims so as to take advantage of the Federal Circuit’s expansive interpretation of software copyright protection. It is no coincidence that Cisco filed its complaint alleging software patent and copyright causes of action against Arista Networks after the Federal Circuit’s 2014 Oracle v. Google decision.300 The following sections explore ways in which the courts and Congress can ensure fidelity to regional circuit copyright law and prevent appellate forum shopping.

B. Analytical Framework for Assessing Appellate Intellectual Property Jurisdiction

If we were assessing the design of intellectual property jurisdiction on a clean slate, the role for specialization and expertise would come centrally into play.301 This article, however, operates within legislative landscape underlying the federal appellate system. There are four principal considerations within that constrained universe that guide the analysis of appellate jurisdiction of cases presenting both patent and copyright causes of action: jurisprudential integrity, federalism, specialization bias, and administrative efficiency.

1. Jurisprudential Integrity

The primary goal of appellate review is to ensure correct interpretation and application of the law. The traditional hierarchical nesting of district courts within regional circuits solves this problem through direct review of decisions by the regional circuit in which the district court sits. Intra-circuit splits can be addressed through en banc review. The Supreme Court provides a final judicial check and typically only intervenes to resolve inter-circuit splits.

Due to the divided appellate authority for patent and non-patent issues, the federal judiciary comprises an overlap of appellate authority. By allocating exclusive jurisdiction to the Federal Circuit for patent appeals, the Federal Courts Improvement Act of 1981 created a form of surrogate appellate review of non-patent issues. The Federal Circuit must interpret and apply the law of regional circuits in reviewing non-patent issues. Such interpretive capacity is not uncommon within hierarchical judicial systems. For example, federal courts routinely interpret

300 See Hardy, supra note __; Graham, supra note __.
state and foreign law and state courts are called upon to interpret the law of other states. Nonetheless, such surrogate review creates the potential for the emergence of potentially conflicting bodies of regional circuit law. If there is not effective means of checking the interpretive divergence, the integrity of regional jurisprudence is compromised.

While the interpretation and application of the law of another jurisdiction operates smoothly when the regional circuit law is settled, the task becomes difficult when the regional circuit law is inchoate, ambiguous, or evolving. In such circumstances, Federal Circuit review of non-patent issues creates a risk of divergent interpretation of regional circuit law.

2. Federalism

The division of responsibility among regional circuits reflects political struggles and compromises dating to the nation’s founding. Deep divisions among the nation’s founders hampered the establishment of a coherent intermediate appellate system for more than a century. At the nation’s founding and continuing to some extent to this day, Federalists and Anti-Federalists divided over the extent of federal power. Federalists advocated a substantial national government and a strong lower federal judiciary. Anti-Federalists sought to weaken federal power, including judicial authority. They advocated passage of a Bill of Rights to protect citizens against the tyranny of national government and preferred to leave judicial power within state government. The clash of perspectives played out in the First Congress in 1789, resulting in a grand compromise that produced the Bill of Rights and a limited system of lower federal courts tied to state boundaries.

The 1789 Judiciary Act established three judicial levels—district courts, circuit courts, and, as set forth in the Constitution, the Supreme Court. The former and the latter levels corresponded roughly to their modern forms. Each state had a single district court. District court jurisdiction, however, was quite limited and far narrower than the Constitution authorized. Congress authorized federal district courts to adjudicate admiralty, diversity of citizenship, federal criminal, and U.S. plaintiff cases. The original U.S. Supreme Court had a Chief Justice and five associate justices.

---

304 Reflecting the complexity and dynamism of the issues and the times, James Madison, an early Federalist and advocate for ratification of the United States Constitution as the foundation for a strong national power, see Federalist Paper No. 10, broke with Alexander Hamilton and the Federalist Party in 1891 and organized the Democratic-Republican Party with Thomas Jefferson. He played a central role in drafting and ratifying the Bill of Rights, a cornerstone of the Anti-Federalists’ effort to weaken national power.
The early circuit courts, however, were quite different from their contemporary counterparts. The jurisdiction of the circuit courts was limited to cases involving diversity of citizenship, major federal crimes, cases brought by the U.S. government, and larger civil and admiralty cases. The three circuit courts (one for northeastern districts, one for central Atlantic states, and one for southern states) sat twice each year in one or two specified cities of each district. The circuit panel comprised two Supreme Court justices assigned to that circuit (and hence the phrase “riding circuit”) and the district judge in that district. (There was initially only one district judge authorized for each district (state).)

As the United States’ geographical reach and national economy developed, the jurisdiction and size of the federal judiciary grew, and federal law expanded, the need for more effective judicial administration increased. For much of the first century of the United States judiciary, the circuit courts operated principally through Supreme Court justices “circuit riding” among the districts and hearing appeals in conjunction with district judges.

In his first State of the Union message to Congress in 1861, President Lincoln declared that “the country has outgrown our present judicial system.” He noted that the eight recently admitted states had never had “circuit courts attended by supreme judges” and that adding enough justices to the Supreme Court to accommodate all the circuit courts that were needed would make the Supreme Court “altogether too numerous for a judicial body of any sort.” Lincoln proposed fixing the Supreme Court at a “convenient number,” irrespective of the number of circuits and dividing the country “into circuits of convenient size.” The circuit courts could be served by either Supreme Court justices or judges appointed specifically for the circuit courts.

As the backlog of appeals grew, Congress eventually established nine circuit judgeships in 1869, far below the number needed to handle to mushrooming appellate backlog. The Judiciary Act of 1875 expanded federal jurisdiction to included federal questions and cases alleging more than $500 in controversy. Growing dockets and budgetary pressures strained the federal judiciary. Much of the burden fell to the 65-odd district judges, who were hearing close to 90 percent of the appeals by the 1880s in addition to their large and growing trial court

305 See Wheeler & Harrison, supra n. __, at 9. Congress doubled the number of circuit courts in 1802, with one Supreme Court justice assigned to each circuit. Act of Apr. 29, 1802, 2 Stat. 118 (1802). As the number of states and territories expanded, necessitating additional district and circuit courts, Congress expanded the number of Supreme Court justices accordingly. In 1863, Congress created a tenth seat on the Supreme Court. Act of Mar. 3, 1863, 12 Stat. 794 (1863) (“To provide Circuit Courts for the Districts of California and Oregon . . .”), although the full court rarely convened due to illness and vacancies. See Carl B. Swisher, The Taney Period, 1836–64, vol. 4 of the Oliver Wendell Holmes Devise, The History of the Supreme Court of the United States 839 (1974). Six years later Congress set the number of justices at nine, see Judiciary Act of 1869, 16 Stat. 44, where it has remained.

306 See Wheeler & Harrison, supra n. __, at 7-19.

Furthermore, the Supreme Court was obliged to hear almost all cases in which litigants sought high court review, resulting in a massive logjam at the top of the federal judiciary pyramid.309

Thus, a century after its establishment, the federal judiciary was in crisis.310 Supreme Court justices had long abandoned riding circuit. The ranks of intermediate circuit judgeships were inadequate to handle the rising appellate caseload, adding substantial additional burden to an overextended district judge corps. Moreover, broad access to the Supreme Court impeded its capacity to review cases with alacrity.

Dissatisfaction with the operation of the federal judiciary ultimately led Congress to pass the Circuit Court of Appeals Act of 1891,311 commonly referred to as the Evarts Act, establishing the modern circuit court system. Senator Evarts orchestrated a compromise that increased the role of the national courts while preserving state and regional influence.312 Furthermore, the legislation substantially shifted the Supreme Court’s workload to nine separate regional circuit courts of appeals and authorized the appointment of 19 circuit court judges, three for the Second Circuit and two for each of the others.

The relatively small scale of appellate courts, initially 19 circuit judges among the nine regional circuits, functioned smoothly during the first several decades, leaving the Supreme Court to focus on inter-circuit splits. As Congress expanded the size of the appellate judiciary to address growing caseloads, the problem of intra-circuit splits emerged. The Supreme Court addressed these issues by authorizing en banc review of intra-circuit conflicts.313 Congress codified the Supreme Court’s Textile Mills decision in passing the Judicial Code of 1948.314

308 See FELIX FRANKFURTER & JAMES LANDIS, THE BUSINESS OF THE SUPREME COURT 60, 79 (1928) (reporting that the number of cases pending in the federal courts rose 86% - from 29,000 to 54,000 - between 1873 and 1890).
309 By 1890, the Supreme Court has 1,816 cases on its docket, including 623 cases filed that year. See FRANKFURTER & LANDIS, supra n.__, at 101-02.
312 See WHEELER & HARRISON, supra n.__, at 16-18
314 See Act of June 25, 1948, ch. 646, 62 Stat. 871; Pub. L. 88-176. Section 46(c) of the Judicial Code of 1948 provided that circuit courts could convene en banc panels upon a majority vote of active judges in the circuit. “A court in banc shall consist of all active circuit judges of the circuit.” Congress left the specific procedures and standards for doing so, however, to the circuit courts.
Congress’s decision to centralize and consolidate appellate patent review consciously diverged from the federalist structure of the appellate courts so as to eliminate the interpretive confusion and forum shopping that had emerged in the patent law field. Yet, federalism concerns were voiced during consideration of the Federal Courts Improvement Act\textsuperscript{315} and Congress retained the federalist judicial structure for non-patent issues. The failure to provide a mechanism to ensure fidelity to regional circuit law, however, creates the potential for the confusion manifest in the \textit{Oracle v. Google} litigation.

3. Specialization Bias

Political scientists, legal scholars, and jurists have long worried that specialized courts are more prone to political influences\textsuperscript{316} and tunnel vision\textsuperscript{317} than courts of general jurisdiction.\textsuperscript{318}

\textsuperscript{315} See, e.g., Additional Views of Senator Max Baucus, \textit{supra} note ___ (quoting the Hruska Commission report:)

Giving a national court exclusive jurisdiction over appeals in a category of cases now heard by the circuit courts would tend to dilute or eliminate regional influence in the decision of those cases. Our nation is not yet so homogenous that the diversity of our people cannot be reflected to some advantage in the decisions of the regional courts. Excluding these courts from consideration of particular categories of cases would also contract the breadth of experience and knowledge which the circuit judges would bring to bear on other cases; the advantages of decision making by generalist judges diminish as the judge’s exposure to varied areas of the law is lessened.

\textit{[Hruska Commission Report, 67 F.R.D. at 235]}; \textit{id.} (commenting that “[m]any of us in the Congress have been greatly disturbed by the growing trend toward centralizing decision making in Washington, D.C. Many of us have supported venue reform to ensure that cases are litigated in States, where the problems arise, rather than in the District of Columbia. Similarly, I believe that we must avoid centralized specialty courts”); Additional Views of Senator Patrick J. Leahy on S. 1700, \textit{supra} note ___ (advocating creation of the Federal Circuit, but agreeing with “the concerns expressed about the precedent of establishing specialty courts, which in general would be very detrimental to our tradition of diversity and independence on the bench”).

\textsuperscript{317} See Alan B. Parker, \textit{Examining Distinctive Jurisprudence in the Federal Circuit: Consequences of a Specialized Court}, 3 AKRON INTELL. PROP. J. 269, 287-89 (2009) (discussing...
The legislative record shows that corporate interests played a large role in creating the Federal Circuit. In a study of the Court of Customs and Patent Appeals (CCPA), one of the courts merged into the Federal Circuit that handled appeals of patent examination, Professor Lawrence Baum found that “[t]he patent specialists on the court, appointed through the efforts of the patent bar, have led the CCPA to adopt a line of policy significantly different from the patent policies that prevail in most of the federal judiciary. The CCPA’s specialization ultimately has been responsible for the court’s distinctive path in the past two decades.”

The legislation creating the Federal Circuit as well as the initial appointment of jurists from the CCPA implanted a mission of strengthening the patent system through statutory interpretation and evolution of non-statutory patent doctrines. This mission has been reinforced through the emergence of a dedicated, well-funded bar and numerous patent-focused industry organizations. While such organizations produce valuable research and education, it concerns of doctrinal, intellectual, and judicial isolation); Rochelle Cooper Dreyfuss, The Federal Circuit: A Case Study in Specialized Courts, 64 N.Y.U. L. REV. 1, 3 (1989); Simon Rifkind, A Special Court for Patent Litigation? The Danger of a Specialized Judiciary, 37 A.B.A.J. 425, 425-26 (1951) (expressing concern that the specialization and “seclusiveness” of patent law “immunizes it against the refreshment of new ideas, suggestions, adjustments and compromises which constitute the very tissue of any living system of law”).

318 See generally WILLIAM M. LANDES & RICHARD A. POSNER, THE POLITICAL ECONOMY OF INTELLECTUAL PROPERTY LAW 26-27 (2004) (arguing that “a specialized court is more likely to have a ‘mission’ orientation than a generalist court”); William M. Landes & Richard A. Posner, An Empirical Analysis of the Patent Court, 71 U. CHI. L. REV. 111, 111-12 (2003) (positing that a specialized patent court is more likely than a generalist court to take a strong stance on its subject matter because “interest groups that had a stake in patent policy would be bound to play a larger role in the appointment of the judges of such a court than they would in the case of the generalist federal courts”).

321 See Paul R. Gugliuzza, Rethinking Federal Circuit Jurisdiction, 100 GEO. L.J. 1437, 1458 (2012); LANDES & POSNER, supra note __, at 26-27 (noting that the Federal Circuit “has defined its mission as promoting technological progress by enlarging patent rights”).

would be naive to think that the ecosystem surrounding patent adjudication did not promote the agenda of the most active and interested constituencies.323

Academic research finds that the Federal Circuit has strengthened patent protection through statutory interpretation and evolution of non-statutory patent doctrines. Multiple scholars have chronicled particular doctrinal patterns (such as formalism and textualism) that strengthen patent protection.324 Empirical research finds that the Federal Circuit views patent holders more favorably than regional circuit courts.325

It is important to note, however, that the Federal Circuit has not always expanded the scope of patent protection. For example, the Federal Circuit’s formalism led the court to cabin the doctrine of equivalents.326 More recently, the Federal Circuit has reined in patent damage theories.327 On balance, however, the Federal Circuit has favored broad patentability,328 narrow

Association, intellectual property owners, pharmaceutical industry, and high technology industries have long had strong advocacy arms. The biotechnology and software industries have become increasingly active. Not all of these constituencies favor strong patent rights, which produced a more complex political dynamic during the past two decades and the lead-up to the America Invents Act. Nonetheless, the Federal Circuit has remained focused on strong patent rights and a robust patent system.

327 See VirnetX, Inc. v. Cisco Sys., Inc., 767 F.3d 1308 (Fed. Cir. 2014); LaserDynamics Inc. v. Quanta Computer, Inc., 694 F.3d 51 (Fed. Cir. 2012); Uniloc USA, Inc. v. Microsoft
These tendencies raise the concern that the Federal Circuit would favor a broader scope of copyright protection for computer software than regional circuit courts. The Federal Circuit’s 2014 *Oracle v. Google* decision appears to bear this out. The Federal Circuit downplayed the legislative concern for ensuring that copyright protection for computer software does not extend to functional features, which is the province of patent protection. Moreover, the court read the Ninth Circuit’s jurisprudence, particularly the *Sega* decision, narrowly. Furthermore, the court placed great emphasis on its own application of Ninth Circuit law in the *Atari Games* case.331

It is perhaps surprising that the Federal Circuit’s formalism and experience with patent law did not push the court toward a more narrow scope of copyright protection. As the panel recognized, the fair use doctrine is the most unpredictable doctrine in copyright law.332 Furthermore, broad copyright for computer software impinges on patent law’s primacy in promoting technological advance. *Baker v. Selden* preempts copyright protection of functional elements and methods of operation. Nonetheless, protecting intellectual property carried the day. It is reasonable to believe that like the First Circuit in *Lotus v. Borland*, the Ninth Circuit would have taken greater cognizance of the anti-competitive concerns of broad intellectual property protection. The legislative history of the Federal Courts Improvement Act highlighted the concern that a patent-centric specialty court might be less sensitive to antitrust policy.333

4. Administrative Efficiency

Administrative efficiency weighs against regional circuit jurisprudential integrity, federalism, and specialization bias considerations in allocating appellate jurisdiction. Various doctrines promote bundling of causes of action arising out of the same transaction or occurrence so as to prevent piecemeal litigation. There may be administrative efficiency reasons to bundle the appeal of those causes of action as well, but such efficiencies might be relatively modest and in tension with other jurisdictional considerations.

District judges have substantial flexibility in managing litigation, including staging and bifurcation. Judge Alsup sensibly phased the copyright and patent causes of action in Oracle v. Google with both sets of issues tried to the same jury. This will generally be sound case management due to the substantial differences between patent and copyright law.

Given that Oracle did not appeal dismissal of the patent causes of action, there is no administrative efficiency (or other) basis for the Federal Circuit, as opposed to the Ninth Circuit, to hear the Oracle v. Google appeal. The challenge of inferring what a Ninth Circuit panel would do could have been avoided. Moreover, appeal to the Ninth Circuit would have assured regional circuit jurisprudential integrity. Furthermore, it is not clear that dividing the case along patent and non-patent causes of action where both sets of issues are appealed would add substantial complexity. The next section explores these scenarios.

C. Refining Appellate Intellectual Property Jurisdiction

The challenge for jurists and policymakers is promoting faithful interpretation of regional circuit non-patent jurisprudence without jeopardizing administrative efficiency. The development of a distinct line of Federal Circuit interpretation of regional circuit jurisprudence opens up the potential for a new form of forum shopping. By pursuing patent claims with non-patent causes of action, parties can opt into the Federal Circuit’s interpretation of regional circuit law. That might be advantageous where an intellectual property owner seeks a more expansive interpretation of intellectual property protection. Moreover, because of the lack of error correction short of Supreme Court review, the jurisprudential structure of the federal appellate

335 See Restatement (Second) of Judgments § 24(1) (1982) (“When a valid and final judgment rendered in an action extinguishes the plaintiff’s claim . . . the claim extinguished includes all rights of the plaintiff to remedies against the defendant with respect to all or any part of the transaction, or series of connected transactions, out of which the action arose.”); see generally, Wright & Miller, Federal Practice & Procedure, § 4401-09.

judiciary will be distorted. Contrary to Congress’s intent, the Federal Circuit will be able to effectively override regional circuit non-patent bodies of law.

This section proposes restructuring appellate intellectual property jurisdiction along case management lines. Section 1 analyzes district court case management options. Section 2 analyzes appellate case management reforms.

1. District Court Case Management and Routing of Appellate Review

The core appellate jurisdiction problem traces back to the filing of a complaint asserting patent and non-patent causes of issues. Once the complaint is filed, Section 1295(a)(1) of the Title 28 confers exclusive appellate jurisdiction on the Federal Circuit. Yet Congress seeks to have regional circuit law (or possibly state law) apply to the non-patent causes of action. By starting with district court case management, various opportunities to promote fidelity to regional circuit can be pursued while preserving the Federal Circuit’s authority to interpret and apply federal patent law.

Although the patent and non-patent issues may share a common nucleus of operative facts, the applicable legal standard may be sufficiently distinct that it makes sense to phase or bifurcate trial of the causes of action as occurred in the Oracle v. Google case. To the extent that the district court keeps the trial and post-trial rulings separate, it is as if separate cases have been adjudicated.

If only patent or non-patent issues are appealed, jurisdictional integrity and federalism considerations favor having those issues resolved by the appellate tribunal with primary authority: the Federal Circuit for patent issues and the regional circuit court for the non-patent issues. Thus, there is not loss in administrative efficiency for cases in which patent issues are not appealed, the most obvious solution would be vest jurisdiction over appeal of the non-patent issues with the regional appellate court. This could be accomplished by amending § 1295(a)(1) of Title 28 of the U.S. Code to exclude from the Federal Circuit’s appellate jurisdiction cases that do not appeal issues arising under the Patent Act or Plant Variety Protection Act.

If both patent and non-patent issues are appealed, the only difference would be that the case would be effectively divided into separate causes of action and the timing of appeals and remands could affect case management. But since the case was already phased or bifurcated, appellate bifurcation would be straightforward and not add significant additional administrative cost. The district court would retain jurisdiction and could adapt any further proceedings based on the outcome and timing of the parallel appellate processes. Section 1295(a) could be amended to provide for cases in which the non-patent issues have been tried separately—whether through phasing or bifurcation—to fall within the appellate jurisdiction of the regional circuit court of appeals.

That leaves cases in which the patent and non-patent issues have been litigated in a combined proceeding and are intertwined. This might occur, for example, in cases involving
patent claims and antitrust counterclaims. Even in such scenarios, the appeal could be best handled by the regional circuit court if no patent issues are appealed. If patent issues or patent and inter-related non-patent issues are appealed, then the Federal Circuit has primacy in adjudicating the appeal.

2. Appellate Jurisdiction Reforms

Even where the Federal Circuit considers regional circuit law questions, there are several opportunities for improving fidelity to regional circuit jurisprudence. Section i considers implementation of a system analogous to the certification of state law questions to the highest state court tribunal. Section ii considers adding a second tier of appellate review at the regional circuit level. Section iii discusses ramifications for the Supreme Court’s role.

i. Certification of Questions to Regional Circuit Courts

The federal courts have long dealt with the interpretation and application of other bodies of law. Following the Supreme Court’s decision in *Erie Railroad Co. v. Tompkins*\(^ {337}\) largely eliminating general federal common law, federal courts have had to apply state law in diversity jurisdiction cases. Beginning in the 1960s, most states have afforded federal courts the option of certifying questions of state law to the highest court in the state.\(^ {338}\) The federal court can go directly to the highest state court to resolve difficult interpretive questions. This process, however, is at the discretion of the federal court.

Although Congress could authorize an analogous process for the Federal Circuit to certify complex questions of regional circuit law to the regional circuit court, such a process would be unduly cumbersome. Unlike the highest court in a state, regional circuits typically sit in panels of fewer than the full bench. En banc review is a relatively infrequent process. It is also relatively complicated to organize and it can take a long time to render decisions on complex issues. Furthermore, it might be difficult to boil down a question of regional circuit copyright law or other non-patent issue to a clear question that can easily be applied. A better approach would be to develop a mechanism for direct review of the Federal Circuit’s non-patent issues at the regional circuit level.

ii. Regional Circuit Review

Even if the non-patent issues cannot be separated from the patent issues prior to the first appeal level, Congress could provide for Federal Circuit interpretations of regional circuit review to subject an additional layer of appellate review by a regional circuit panel and/or at the en banc level. Thus, Congress could provide for an optional second level of appellate review. A party that

---

\(^{337}\) 304 U.S. 64 (1938).

believed that the Federal Circuit has misinterpreted or misapplied regional circuit jurisprudence could be able to challenge that decision through a second panel review within the regional circuit. Alternatively, a party challenging the Federal Circuit’s interpretation of regional circuit law could file an en banc petition in the regional circuit.

These approaches provide a sensible and balanced solution to the regional circuit jurisprudential integrity and forum shopping problems while avoiding undue administrative costs. In view of the Supreme Court’s severe capacity constraints and disinclination to consider interlocutory appeals and intra-circuit splits, providing litigants a regional circuit review option could provide a valuable secondary screen to ensure fidelity to regional circuit authority. It could also avoid the additional costs from Federal Circuit remands on unnecessary issues. On the cost side of the equation, an additional appellate review would add further time to resolving disputes. But in cases such as Oracle v. Google, such an option would have potentially avoided a costly second trial and would likely have provided a clear answer to core questions about API copyrightability in the Ninth Circuit.

A regional circuit appeal process would also conserve on Supreme Court resources. A misinterpretation of regional circuit law by the Federal Circuit is effectively an intra-circuit split. Had Google had the choice to pursue regional circuit review, it could have avoided filing its interlocutory certiorari petition. The copyright issues would have found their path within the regional circuit process. And only if one of the parties could allege an inter-circuit split would the case become ripe for Supreme Court review.

Whether to limit the second level regional appeal to the panel or en banc level would depend on an analysis of process costs and delay. Limiting a Federal Circuit litigant only to regional circuit en banc review of non-patent issues would save resources, but would likely result in more Federal Circuit mutation of regional circuit law.

iii. Supreme Court Review

If Congress does not act to route appeals of separable non-patent issues to regional circuits and provide an additional layer of circuit review, either panel or en banc, for non-patent issues remaining after Federal Circuit review, then the Supreme Court should expand its

340 See Supreme Court Rule 11 (Certiorari to a United States Court of Appeals before Judgment).

certiorari criteria to consider Federal Circuit misinterpretation of regional circuit law. As the Oracle v. Google litigation highlights, it is possible that the copyrightability of APIs may never be ripe for Supreme Court review under present circumstances. The detour into a fair use trial has submerged the API copyrightability issue, which is of great importance to substantial portion of the software industry.

Conclusions

The Federal Circuit’s exclusive jurisdiction over patent appeals in conjunction with its questionable interpretation of Ninth Circuit copyright law has produced a new class of forum shopping. By combining a patent cause of action with a software copyright cause of action in a district court filing anywhere within the boundaries of the Ninth Circuit, a plaintiff can opt into a far more expansive version of copyright protection than they could obtain if they only pursued the copyright cause of action. Congress specifically warned against the extension of the Federal Circuit’s exclusive jurisdiction over patent appeals to non-patent causes of action governed by regional circuit law.

Fortunately, this problem can be nipped in the bud through some fairly straightforward adjustments to the Federal Circuit’s jurisdiction. Congress can largely rectify the problem by providing for non-patent issues resolved in separable proceedings to be appealed directly to the regional circuit court. Furthermore, Congress can address the problem presented by intertwined patent and non-patent issues by providing for a second level of appellate review of the non-patent issues in the regional circuit.
